

Technical Manual **CL4-E**

Fieldbus: CANopen, USB, Modbus RTU

For use with the following variants:

CL4-E-1-12, CL4-E-2-12, CL4-E-1-12-5VDI, CL4-E-2-12-5VDI

Contents

1 Introduction.....	10
1.1 Version information.....	10
1.2 Copyright, marking and contact.....	10

1 Introduction

The *CL4-E* is a controller for the *open loop* or *closed loop* operation of stepper motors and the *closed loop* operation of BLDC motors.

This manual describes the functions of the controller and the available operating modes. It also shows how you can address and program the controller via the communication interface.

You can find further information on the product on us.nanotec.com.

1.1 Version information

Manual version	Date	Changes	Firmware version	Hardware version
1.0.0	10/2018	First edition	FIR-v1825	W002
1.1.0	08/2019	<ul style="list-style-type: none"> ■ New chapter Configuring the sensors ■ Changes and additions in chapter Closed Loop ■ New sections in chapter <i>Control modes: Controller structure</i>, Feed forward, Assignment of the feedbacks to the control loops and Slow Speed ■ Minor additions and error corrections in the object dictionary 	FIR-v1926	W002
1.2.0	11/2019	Error corrections	FIR-v1939	W002
1.3.0	11/2020	<ul style="list-style-type: none"> ■ New chapter Analog inputs ■ New objects 606F_h and 6070_h for monitoring the actual speed in <i>Profile Velocity</i> mode ■ New object 1006_h for setting the cycle time of generated sync messages ■ New object 3250_h:09_h for switching the LEDs on/off ■ New object 320E_h:0D_h for setting a voltage feed forward (see Feed forward) ■ New objects 320E_h:0F_h and 320E_h:05_h for setting the maximum PWM voltage ■ New object 4021_h for configuring the ballast circuit 	FIR-v2039	W002
1.4.0	09/2021	Additions and error corrections	FIR-v2139	W002

1.3 Intended use

The *CL4-E* serves to control stepper motors and BLDC motors and is used as a component in drive systems in a wide range of industrial applications.

Use the product as intended within the limits defined in the technical data (in particular, see Permissible operating voltage) and the approved Environmental conditions.

Under no circumstances may this Nanotec product be integrated as a safety component in a product or system. All products containing a component manufactured by Nanotec must, upon delivery to the end user, be provided with corresponding warning notices and instructions for safe use and safe operation. All warning notices provided by Nanotec must be passed on directly to the end user.

1.4 Target group and qualification

The product and this documentation are directed towards technically trained specialists staff such as:

- Development engineers
- Plant engineers
- Installers/service personnel
- Application engineers

Only specialists may install, program and commission the product. Specialist staff are persons who

- have appropriate training and experience in working with motors and their control,
- are familiar with and understand the content of this technical manual,
- know the applicable regulations.

1.5 Warranty and disclaimer

Nanotec assumes no liability for damages and malfunctions resulting from installation errors, failure to observe this manual or improper repairs. The selection and use of Nanotec products is the responsibility of the plant engineer or end user. Nanotec accepts no responsibility for the integration of the product in the end system.

Our general terms and conditions at www.nanotec.com apply.

NOTE

Changes or modifications to the product are not permitted.

1.6 EU directives for product safety

The following EU directives were observed:

- RoHS directive (2011/65/EU, 2015/863/EU)

1.7 Other applicable regulations

In addition to this technical manual, the following regulations are to be observed:

- Accident-prevention regulations

- Local regulations on occupational safety

1.8 Used icons

All notices are in the same format. The degree of the hazard is divided into the following classes.

CAUTION	
	<p>The CAUTION notice indicates a possibly dangerous situation.</p> <p>Failure to observe the notice may result in moderately severe injuries.</p> <ul style="list-style-type: none"> ▶ Describes how you can avoid the dangerous situation.
NOTE	
	<p>Indicates a possible incorrect operation of the product.</p> <p>Failure to observe the notice may result in damage to this or other products.</p> <ul style="list-style-type: none"> ▶ Describes how you can avoid the incorrect operation.
TIP	
	<p>Shows a tip for the application or task.</p>

1.9 Emphasis in the text

The following conventions are used in the document:

Underlined text indicates cross references and hyperlinks:

- The following bits in object 6041_h (statusword) have a special function:
- A list of available system calls can be found in chapter NanoJ functions in the NanoJ program.

Text set in *italics* marks named objects:

- Read the *installation manual*.
- Use the *Plug & Drive Studio* software to perform the auto setup.
- For software: You can find the corresponding information in the *Operation* tab.
- For hardware: Use the *ON/OFF* switch to switch the device on.

A text set in *Courier* marks a code section or programming command:

- The line with the `od_write(0x6040, 0x00, 5);` command has no effect.
- The NMT message is structured as follows: `000 | 81 2A`

A text in "quotation marks" marks user input:

- Start the NanoJ program by writing object 2300_h, bit 0 = "1".
- If a holding torque is already needed in this state, the value "1" must be written in 3212_h:01_h.

1.10 Numerical values

Numerical values are generally specified in decimal notation. The use of hexadecimal notation is indicated by a subscript *h* at the end of the number.

The objects in the object dictionary are written with index and subindex as follows: <Index>:<Subindex>

Both the index as well as the subindex are specified in hexadecimal notation. If no subindex is listed, the subindex is 00_h.

Example: Subindex 5 of object 1003_h is addressed with 1003_h:05_h, subindex 00 of object 6040_h with 6040_h.

1.11 Bits

The numbering of individual bits in an object always begins with the LSB (bit number 0). See the following figure, which uses data type *UNSIGNED8* as an example.

	MSB							LSB	
Bit Number	7	6	5	4	3	2	1	0	
Bits	0	1	0	1	0	1	0	1	≅ 55 _{hex} ≅ 85 _{dec}

1.12 Counting direction (arrows)

In figures, the counting direction is always in the direction of an arrow. Objects 60C5_h and 60C6_h depicted as examples in the following figure are both specified as positive.

2 Safety and warning notices

NOTE

Damage to the controller!

Changing the wiring during operation may damage the controller.

- ▶ Only change the wiring in a de-energized state. After switching off, wait until the capacitors have discharged.

NOTE

Damage to the controller due to excitation voltage of the motor!

Voltage peaks during operation may damage the controller.

- ▶ Install suitable circuits (e.g., charging capacitor) that reduce voltage peaks.

NOTE

Damage to the electronics through improper handling of ESD-sensitive components!

The device contains components that are sensitive to electrostatic discharge. Improper handling can damage the device.

- ▶ Observe the basic principles of ESD protection when handling the device.

NOTE

Damage to the electronics if the supply voltage is connected with reversed polarity!

- ▶ Install a line protection device (fuse) in the supply line.

3 Technical details and pin assignment

3.1 Environmental conditions

Environmental condition	Value
Protection class	No IP protection
Ambient temperature (operation)	-10 ... +40°C
Air humidity (non-condensing)	0 ... 95 %
Max. Altitude of site above sea level (without drop in performance)	1500 m
Ambient temperature (storage)	-25 ... +85°C

3.2 Dimensioned drawing

All dimensions are in millimeters.

3.3 Electrical properties and technical data

Property	Description / value
Operating voltage	12 ... 58 V DC

Property	Description / value
Voltage range of the logic supply	12 ... 30 V DC
Rated current	CL4-E-1-xx, <i>low current</i> : 3 A _{rms} CL4-E-2-xx, <i>high current</i> : 6 A _{rms}
Peak current	CL4-E-1-xx, <i>low current</i> : 6 A _{rms} for 5 seconds CL4-E-2-xx, <i>high current</i> : 18 A _{rms} for 5 seconds
Commutation	Stepper motor – open loop, stepper motor – closed loop with encoder, BLDC motor – closed loop with Hall sensor, and BLDC motor – closed loop with encoder
Operating modes	<i>Profile Position Mode, Profile Velocity Mode, Profile Torque Mode, Velocity Mode, Homing Mode, Interpolated Position Mode, Cyclic Sync Position Mode, Cyclic Sync Velocity Mode, Cyclic Synchronous Torque Mode, Clock-Direction Mode</i>
Set value setting / programming	<i>Clock-direction, analog, NanoJ program</i>
Interfaces	CANopen, RS-485 (Modbus RTU), USB (configuration interface)
Inputs	<ul style="list-style-type: none"> ■ 4 digital inputs: <ul style="list-style-type: none"> □ 24 V for the variants with article numbers <i>CL4-E-1-12</i> and <i>CL4-E-2-12</i> □ 5 V for the variants with article numbers <i>CL4-E-1-12-5VDI</i> and <i>CL4-E-2-12-5VDI</i> ■ 1 analog input, 10-bit resolution, 0-10 V
Outputs	2 digital outputs, positive switching (typical output voltage corresponds to the connected logic supply – 0.6 V)
Protection circuit	Overvoltage and undervoltage protection Overtemperature protection (> 75° Celsius on the power board)

3.4 Overtemperature protection

Above a temperature of approx. 75°C on the power board the power part of the controller switches off and the error bit is set (see objects [1001_h](#) and [1003_h](#)). After cooling down and confirming the error (see [table for the controlword](#), "Fault reset"), the controller again functions normally.

The following temperature test results provide information on the temperature behavior of this controller.

Temperature tests are performed under the following conditions:

- Operating voltage: 24 V DC
- Motor current: 3 A (CL4-E-1-xx *low current*)/6 A (CL4-E-2-xx *high current*) rms
- Operation mode: Velocity Mode, full step, 30 rpm
- Ambient temperature: 25 °C / 45 °C
- Altitude of site: 500 m above sea level
- No external cooling in the climatic chamber, e. g., via fan

The following graphics show the results of the temperature tests:

NOTE

Aside from the motor, the exact temperature behavior is also dependent on the flange connection and the heat transfer there as well as on the convection in the application. For this reason, we recommend always performing an endurance test in the actual environment for applications in which current level and ambient temperature pose a problem.

3.5 LED signaling

3.5.1 Power LED

The power LED indicates the current status.

3.5.1.1 Normal operation

In normal operation, the green power LED L1 flashes briefly once per second.

3.5.1.2 Case of an error

If an error has occurred, the LED turns red and signals an error number. In the following figure, the error number 3 is signaled.

The following table shows the meaning of the error numbers.

Flash rate	Error
1	General
2	Voltage
3	Temperature
4	Overcurrent
5	Controller
6	Watchdog-Reset

**NOTE**

For each error that occurs, a more precise error code is stored in object `1003h`.

**TIP**

You can switch off the power LEDs with `3250h:09h`.

3.6 Pin assignment

3.6.1 Overview

Connector	Function
X1	CANopen / RS-485 IN
X2	CANopen / RS-485 OUT
X3	Encoder/Hall sensor
X4	Inputs and outputs
X5	Motor
X6	Voltage supply
X7	Micro USB
S1	Switch for 150 ohm termination resistor (RS-485)
S2	Switch for 120 ohm termination resistor (CANopen)
DS	Default switch: switch for resetting the communication settings

**NOTE**

All pins with designation *GND* are internally connected.

3.6.2 X1 – CANopen/RS-485 IN

Connection for CANopen and RS-485 (Modbus RTU). Type: JST B5B-XH-A

Suitable Nanotec cable: ZK-XHP-5-500-S (not included in the scope of delivery)

In the following figure, pin 1 is marked with a "1".

Pin	Function	Note
1	RS-485-	
2	RS-485+	
3	CAN_L	CAN-Low
4	CAN_H	CAN-High
5	GND	

3.6.2.1 RS-485 line polarization

NOTE

The controller is **not** equipped with line polarization and expects the master device to have one.

If the master device on the bus does not have line polarization of its own, a pair of resistors must be attached to the RS-485 balanced cables:

- A pull-up resistor to a 5V voltage on the RS-485+ (D1) cable
- A pull-down resistor to earth (GND) on the RS-485- (D0) cable

The value of these resistors must be between 450 ohm and 650 ohm. A 650 ohm resistor permits a higher number of devices on the bus.

In this case, a line polarization must be attached at a location for the entire serial bus. In general, this location should be on the master device or its connection. All other devices then no longer need to implement line polarization.

3.6.3 X2 – CANopen/RS-485 OUT

Connection for CANopen and RS-485 (Modbus RTU). Type: JST B5B-XH-A

Suitable Nanotec cable: ZK-XHP-5-500-S (not included in the scope of delivery)

In the following figure, pin 1 is marked with a "1".

Pin	Function	Note
1	RS-485-	
2	RS-485+	
3	CAN_L	CAN-Low
4	CAN_H	CAN-High
5	GND	

3.6.4 X3 – encoder/Hall sensor

Type: JST B8B-XH-A

Suitable Nanotec cable: ZK-XHP-8-500-S (not included in the scope of delivery)

In the following figure, pin 1 is marked with a "1".

Pin	Function	Note
1	+5 V DC	Supply voltage for encoder/Hall sensor, max. 200 mA
2	A	5 V signal, max. 1 MHz
3	B	5 V signal, max. 1 MHz
4	Index	5 V signal
5	H1	5 V signal
6	H2	5 V signal
7	H3	5 V signal
8	GND	

The following switching thresholds apply for the encoder inputs:

Max. Voltage	Switching thresholds	
	On	Off
5 V	> 2 V	< 0.8 V

3.6.5 X4 – inputs and outputs

Type: JST B8B-XH-A

Suitable Nanotec cable: ZK-XHP-8-500-S (not included in the scope of delivery)

In the following figure, pin 1 is marked with a "1".

Pin	Function	Note
1	Digital input 1	
2	Digital input 2	
3	Digital input 3	Direction input in clock-direction mode, max. 1 MHz
4	Digital input 4	Clock input in clock-direction mode, max. 1 MHz
5	Analog input 1	10 bit, 0-10 V
6	Digital output 1	Positive switching (<i>high-side switch</i>), max. 100 mA
7	Digital output 2	Positive switching (<i>high-side switch</i>), max. 100 mA
8	GND	

NOTE

To use the digital outputs, you must connect a voltage (12...30 V DC) to pin 2 of X6 (logic supply). The typical output voltage corresponds to the connected logic supply – 0.6 V. The current should not exceed 100 mA.

For the digital inputs of the variants with article numbers *CL4-E-1-12* and *CL4-E-2-12*, the following switching thresholds apply:

Max. Voltage	Switching thresholds	
	On	Off
24 V	> 9 V	< 3.7 V

For the digital inputs of the variants with article numbers *CL4-E-1-12-5VDI* and *CL4-E-2-12-5VDI*, the following switching thresholds apply:

Max. Voltage	Switching thresholds	
	On	Off
5 V	> 2 V	< 0.8 V

3.6.6 X5 – motor connection

In the following figures, pin 1 is marked with a "1".

Type:

- CL4-E-1-xx *low current*: JST B4B-XH-A
Suitable Nanotec cable: ZK-XHP-4-300 (not included in the scope of delivery)

- CL4-E-2-xx *high current*: JST B4P-VH
Suitable Nanotec cable: ZK-VHR-4-500 (not included in the scope of delivery)

Pin	Stepper motor function	BLDC function	Note
1	A	U	
2	A\	V	
3	B	W	
4	B\	n.c.	

3.6.7 X6 – voltage supply

Connection for the main supply and logic supply.

In the following figures, pin 1 is marked with a "1".

Type:

- CL4-E-1-xx *low current*: JST B3B-XH-A
 Suitable Nanotec cable: ZK-XHP-3-500 (not included in the scope of delivery)

- CL4-E-2-xx *high current*: JST B3P-VH
 Suitable Nanotec cable: ZK-VHR-3-500 (not included in the scope of delivery)

3.6.7.1 Voltage source

The operating or supply voltage supplies a battery, a transformer with rectification and filtering, or a switching power supply.

NOTE

EMC: For a DC power supply line longer than 30 m or when using the motor on a DC bus, additional interference-suppression and protection measures are necessary.

- ▶ An EMI filter is to be inserted in the DC supply line as close as possible to the controller/motor.
- ▶ Long data or supply lines are to be routed through ferrites.
- ▶ A capacitor of at least 4700 μF is to be connected to the supply voltage (parallel) as close to the controller as possible.

3.6.7.2 Pin assignment

Pin	Function	Note
1	+Ub	12 ... 58 V DC
2	+UB Logic	12 ... 30 V DC, input voltage for the optional logic supply and digital outputs Current consumption without outputs: approx. 27 mA
3	GND	

NOTE

Should the main supply fail, the logic supply keeps the electronics, the encoder and the communication interface in operation.

The windings of the motor are not supplied by the logic supply.

3.6.7.3 Permissible operating voltage

The maximum operating voltage is 58 V DC. If the input voltage of the controller exceeds the threshold value set in `2034h`, the motor is switched off and an error triggered. Above the response threshold set in `4021h:02h`, the integrated ballast circuit is activated (wirewound resistor Z32041412209K6C000 from Vishay with 3 W continuous output).

The minimum operating voltage is 12 V DC. If the input voltage of the controller falls below 10 V, the motor is switched off and an error triggered.

A charging capacitor of at least 4700 μF / 50 V (approx. 1000 μF per ampere rated current) must be connected in parallel to the supply voltage to avoid exceeding the permissible operating voltage (e.g., during braking).

3.6.8 X7 – Micro USB

A cable of type "micro USB" is needed for this USB connection.

3.6.9 Switch S1 – Termination resistor RS-485

With this DIP switch, termination can be switched on (switch to ON) or off with 150 ohm between RS-485- and RS-485+.

3.6.10 Switch S2 – Termination resistor CANopen

With this DIP switch, termination can be switched on (switch to ON) or off with 120 ohm between CAN-L and CAN_H.

3.6.11 Switch DS – Default switch

To reset the communication settings:

1. Short#circuit the two copper openings (e.g. using a wire bridge).
2. Do this for at least 3 seconds.
3. The address and baud rate are then reset. The controller restarts automatically.

The following objects are affected:

Object	Function	Factory settings
<u>2009</u> _h	CANopen node-ID	127
<u>2005</u> _h	CANopen baud rate	136 (1 MBaud)
<u>2028</u> _h	Modbus slave address	5
<u>202A</u> _h	Modbus baud rate	19200
<u>202D</u> _h	Modbus parity	04 _h (Even)

4 Commissioning

Described in this chapter is how you establish communication with the controller and set the necessary parameters to make the motor ready for operation. You can configure the controller via USB, CANopen or Modbus RTU (RS-485).

The *Plug & Drive Studio* software offers you an option for performing the configuration and adapting the controller to the connected motor. You can find further information in document *Plug & Drive Studio: Quick Start Guide* at us.nanotec.com.

Observe the following note:

NOTE

EMC: Current-carrying cables – particularly around supply and motor cables – produce electromagnetic alternating fields. These can interfere with the motor and other devices.

Suitable measures may be:

- ▶ Use shielded cables and earth the cable shielding on both ends over a short distance.
- ▶ Keep power supply and motor cables as short as possible.
- ▶ Use cables with cores in twisted pairs.
- ▶ Earth motor housing with large contact area over a short distance.
- ▶ Lay supply, motor and control cables separately.

4.1 Configuration via USB

4.1.1 General

The following options are available for configuring the controller via USB:

Configuration file

This file can be saved to the controller via the USB connection. For further information, read chapters [USB connection](#) and [Configuration file](#).

NanoJ program

This program can be programmed, compiled and then transferred to the controller with *NanoJ* via USB. For further information, read chapters [NanoJ program](#) and [Programming with NanoJ](#).

After connecting to a voltage supply, the controller reads out the configuration in the following order:

1. The configuration file is read out and processed.
2. The NanoJ program is started.

4.1.2 USB connection

If the controller is connected to a PC via a USB cable, the controller behaves like a removable storage device. No further drivers are required.

Three files are displayed: the configuration file (`cfg.txt`), the *NanoJ program* (`vmmcode.usr`) and the information file (`info.txt`), where the serial numbers and firmware version of the product can be found.

You can thereby store the configuration file or the *NanoJ program* on the controller. The voltage supply of the controller must also be connected during USB operation.

NOTE

- Only use a standard Micro USB cable. Never use a USB cable that manufacturers of mobile phones include with their products. These USB cables could have a different plug shape or pin assignment.
- Do not save any files on the controller other than those listed below:

1. `cfg.txt`
2. `vmmcode.usr`
3. `info.bin`
4. `reset.txt`

Any other file is deleted when the voltage supply of the controller is switched on!

TIP

Because it is often necessary during commissioning to copy the same file to the controller following an update, it is recommended that a script file be used to perform this task.

- Under Windows, you can create a text file with file extension `bat` and the following content:

```
copy <SOURCE> <TARGET>
```

- Under Linux, you can create a script with file extension `sh` and the following content:

```
#!/bin/bash
cp <SOURCE> <TARGET>
```

4.1.3 Configuration file

4.1.3.1 General

The `cfg.txt` configuration file is used to preset values for the object dictionary to a certain value during startup. This file uses a special syntax to make accessing the objects of the object dictionary as easy as possible. The controller evaluates all assignments in the file from top to bottom.

NOTE

If you delete the configuration file, the controller recreates the file (without content) on the next restart.

4.1.3.2 Reading and writing the file

How to access the file:

1. Connect and switch on the voltage supply.
2. Connect the controller to your PC using the USB cable.
3. After the PC has detected the device as a removable storage device, navigate in the Explorer to the directory of the controller. File `cfg.txt` (for a PD4C, the file is named `pd4ccfg.txt`) is stored there.
4. Open this file with a simple text editor, such as Notepad or Vi. Do not use any programs that use markup (LibreOffice or similar).

After you have made changes to the file, proceed as follows to apply the changes through a restart:

1. Save the file if you have not yet already done so. The motor stops.
2. Disconnect the USB cable from the controller.

3. Disconnect the voltage supply from the controller for approx. 1 second until the power LEDs stop flashing.
4. Reconnect the voltage supply. When the controller is now restarted, the values in the configuration file are read out and applied.

TIP

To restart the controller, you can also copy an empty `reset.txt` file to the controller. This restarts the controller. The `reset.txt` file is deleted on the next restart.

4.1.3.3 Structure of the configuration file

Comments

Lines that begin with a semicolon are ignored by the controller.

Example

```
; This is a comment line
```

Assignments

NOTE

Before setting a value, determine its data type (see chapter [Description of the object dictionary](#))! The controller does not validate entries for logical errors!

Values in the object dictionary can be set with the following syntax:

```
<Index>:<Subindex>=<Value>
```

<Index>

This value corresponds to the index of the object and is interpreted as a hexadecimal number. The value must always be specified with four digits.

<Subindex>

This value corresponds to the subindex of the object and is interpreted as a hexadecimal number. The value must always be specified with two digits and can be omitted if the subindex is 00_h.

<Value>

The value that is to be written in the object is interpreted as a hexadecimal number. Hexadecimal numbers are to be prefixed with "0x".

You can also set individual bits:

Set bit

```
3202:00.03=1
```

Reset bit

```
3202:00.03=0
```

Bitwise OR

```
3202:00|=0x08
```

Bitwise AND

```
3202:00&=0x08
```

Example

Set object 203B_h:01 (rated current) to the value "600" (mA):

```
203B:01=600
```

Set object 3202_h:00 to the value "8" (activate current reduction while at a standstill in *open loop* mode):

```
3202:00=8
```

or only set bit 3

```
3202:00.03=1
```

NOTE

- 
 ■ There must be no blank characters to the left and right of the equal sign. The following assignments are not correct:

```
6040:00 =5
6040:00= 5
6040:00 = 5
```
- The number of places must not be changed. The index must be four characters long and the subindex two characters long. The following assignments are not correct:

```
6040:0=6
6040=6
```
- Blank spaces at the start of the line are not permitted.

4.1.4 NanoJ program

A *NanoJ* program can be executed on the controller. To load and start a program on the controller, proceed as follows:

1. Write and compile your program as described in chapter [Programming with NanoJ](#).
2. Connect the voltage supply to the controller and switch on the voltage supply.
3. Connect the controller to your PC using the USB cable.
4. After the PC has detected the device as a removable storage device, open an Explorer window and delete file `vmmcode.usr` on the controller.

5. Navigate in the Explorer to the directory with your program. The compiled file has the same name as the source code file, only with file extension `.usr`. Rename this file `vmmcode usr`.
6. Copy file `vmmcode usr` to the controller.
To start the *NanoJ program* the next time the controller is restarted, add the following line to the configuration file:

```
2300:00=1
```

7. Disconnect the voltage supply from the controller for approx. 1 second until the power LEDs stop flashing.
8. Reconnect the voltage supply. When the controller now starts, the new *NanoJ program* is read in and started.

TIP

To restart the controller, you can also copy an empty `reset.txt` file to the controller. This restarts the controller. The `reset.txt` file is deleted on the next restart.

NOTE

- The *NanoJ program* on the controller must have file name `vmmcode usr`.
- If the *NanoJ program* was deleted, an empty file named `vmmcode usr` is created the next time the controller is started.

TIP

It is possible to automate the deletion of the old *NanoJ program* and the copying of the new one with a script file:

- Under Windows, you can create a file with file extension `bat` and the following content:

```
copy <SOURCE_PATH>\<OUTPUT>.usr <TARGET>:\vmmcode usr
```

For example:

```
copy c:\test\main usr n:\vmmcode usr
```

- Under Linux, you can create a script with file extension `sh` and the following content:

```
#!/bin/bash
cp <SOURCE_PATH>/<OUTPUT>.usr <TARGET_PATH>/vmmcode usr
```

You can protect your *NanoJ program* from being read out/copied by activating the *hidden* attribute of the FAT file system.

4.2 Configuration via CANopen

All settings for CANopen can be written via the memory mechanism (for further information, see chapter [Saving objects](#)).

4.2.1 Communication settings

Described in the following chapters is how you can change the communication settings.

The controller is configured per default for node-ID 127 and a baud rate of 1 Mbaud.

You can use the [default switch](#) to reset the controller to the factory settings.

4.2.1.1 Setting node-ID and baud rate

In the default setting, the controller starts with a node-ID of 127. If a different node-ID is needed, the new value of the node-ID is entered in object `2009h`.

In the default setting, the controller starts with a baud rate of 1 MBd. The baud rate is entered in object `2005h`. The value for the corresponding baud rate can be found in the following table.

Value		Baud rate in kBd
dec	hex	
129	81	10
130	82	20
131	83	50
132	84	125
133	85	250
134	86	500
136	88	1000

You must save the changes by writing value "65766173_h" in object `1010h:0Ah`. The changes are not taken over until after the controller has been restarted.

4.2.2 Establishing communication

4.2.2.1

Before starting commissioning, we recommend reading chapters [Pin assignment](#) and [CANopen](#) configuration.

1. Connect the CANopen master to the controller via the CAN_L, CAN_H cables. Check the connection of your CAN-GND and that the necessary [120 ohm termination resistor](#) is present between CAN_H and CAN_L.

2. Supply the controller with voltage.

3. Change the configuration values if necessary, see configuration [CANopen](#).

The controller is set per default to node-ID 127, baud rate 1 Mbaud.

4. To test the interface, send bytes `40 41 60 00 00 00 00 00` to the controller.

Statusword (6041_h) was read; you receive this response: `4B 41 60 00 XX XX 00 00`.

4.2.3 Setting using LSS

The *Layer Setting Services* offers you the option to dynamically assign the node-ID and/or the baud rate via the CANopen bus. See chapter [LSS protocol](#).

4.3 Configuring via Modbus RTU

Described in the following chapters is how you can establish the communication.

The controller is set to slave address 5ex works , baud rate 19200 baud, even parity, 1 stop bit. You can use the [default switch](#) to reset the controller to the factory settings. All changes take effect only after the controller is restarted.

4.3.1 Communication settings

The following settings can be performed:

Configuration	Object	Value range	Factory settings
Slave address	<u>2028</u> _h	1 to 247	5
Baud rate	<u>202A</u> _h	7200 to 256000	19200
Parity	<u>202D</u> _h	<ul style="list-style-type: none"> ■ None: 0x00 ■ Even: 0x04 ■ Odd: 0x06 	0x04 (Even)

The number of data bits is always "8" here. The number of stop bits is dependent on the parity setting:

- No parity: 2 stop bits
- "Even" or "Odd" parity: 1 stop bit

The following baud rates are supported:

- 7200
- 9600
- 14400
- 19200
- 38400
- 56000
- 57600
- 115200
- 128000
- 256000

You must save the changes by writing value "65766173_h" in object 1010_h:0B_h. The changes are not taken over until after the controller has been restarted.

4.3.2 Establishing communication

1. Connect the *Modbus master* to the controller via the RS-485+ and RS-485- (see X1 – CANopen/RS-485 IN.) cables.
2. Supply the controller with voltage.
3. Change the configuration values if necessary.

The controller is set to slave address 5ex works , baud rate 19200 baud, even parity, 1 stop bit.

4. To test the interface, send bytes 05 65 55 00 2F A7 to the controller (you can find a detailed description of the Modbus function codes in chapter Modbus RTU).

The object dictionary is read out.

4.4 Setting the motor data

Prior to commissioning, the motor controller requires a number of values from the motor data sheet.

- Number of pole pairs: Object 2030_h:00_h (pole pair count) The number of motor pole pairs is to be entered here. With a stepper motor, the number of pole pairs is calculated using the step angle, e.g., 1.8° = 50 pole pairs, 0.9° = 100 pole pairs (see step angle in motor data sheet). With BLDC motors, the number of pole pairs is specified directly in the motor data sheet.
- Object 2031_h:00_h: maximum permissible motor current (motor protection) in mA (see motor data sheet)
- Object 6075_h:00_h: rated current of the motor in mA (see motor data sheet), limited by 2031_h
- Object 6073_h:00_h: maximum current (for a stepper motor, generally corresponds to the rated current, bipolar) in tenths of a percent of the set rated current (see motor data sheet). Factory settings: "1000", which corresponds to 100% of the value in 6075_h. Is limited by 2031_h.
- Object 203B_h:02_h Maximum duration of the maximum current (6073_h) in ms (for initial commissioning, Nanotec recommends a value of 100 ms; this value is to be adapted later to the specific application).

- Setting the motor type:
 - Stepper motor:
 - Object `3202h:00h` (Motor Drive Submode Select): Defines motor type stepper motor, activates current reduction on motor standstill: 0000008h. See also chapter [Commissioning *open loop*](#).
 - BLDC motor:
 - Object `3202h:00h` (Motor Drive Submode Select): Defines motor type BLDC: 00000040h
- Motor with encoder without index: You must set the encoder parameters after the [Auto setup](#), see chapter [Configuring the sensors](#).

NOTE

Due to the sine commutation and the sinusoidal current flow, the current of a motor winding can achieve an alternating current value that is briefly greater (by max. $\sqrt{2}$ times) than the set current.

At especially slow speeds or while at a standstill with full load, one of the windings can therefore be supplied with overcurrent for a longer period of time. Take this into account when dimensioning the motor and select a motor with larger torque reserve if necessary if required by the application.

4.5 Connecting the motor

After setting the motor parameters, see [Setting the motor data](#), connect the motor and, if applicable, the present sensors (encoders / Hall sensors).

NOTE

Damage to the electronics if motor is connected incorrectly!

- ▶ Observe the PIN assignment in chapter [Pin assignment](#) and the motor data sheet.

- Connect the motor:
 - to connection X5, see [X5 – motor connection](#)
- Connect encoders / Hall sensors:
 - to connection X3, see [X3 – encoder/Hall sensor](#)

4.6 Auto setup

To determine a number of parameters related to the motor and the connected sensors (encoders/Hall sensors), you must perform an auto setup.

TIP

As long as the motor connected to the controller or the sensors for feedback (encoders/Hall sensors) are not changed, auto setup is only to be performed once during initial commissioning.

NOTE

Note the following prerequisites for performing the auto setup:

- ▶ The motor must be load-free.
- ▶ The motor must not be touched.
- ▶ The motor must be able to turn freely in any direction.
- ▶ No NanoJ programs may be running (object `2300h:00h` bit 0 = "0", see [2300h NanoJ Control](#)).

TIP

Execution of the auto setup requires a relatively large amount of processor computing power. During the auto setup, this may result in fieldbuses not being operated in a timely manner.

4.6.1 Parameter determination

Auto setup determines various parameters of the connected motor and of the present sensors by means of multiple test runs and measurement runs. To a certain extent, the type and number of parameters are dependent on the respective motor configuration.

Parameter	All motors independent of the configuration
Motor type (stepper motor or BLDC motor)	✓
Winding resistance	✓
Winding inductance	✓
Interlinking flux	✓

Parameter	Motor without encoder	Motor with encoder and index	Motor with encoder without index
Encoder resolution	-	✓	---
Alignment (shifting of the electrical zero to the index)	-	✓	---

Parameter	Motor without Hall sensor	Motor with Hall sensor
Hall transitions	-	✓

4.6.2 Execution

Before performing the *auto setup*, make certain that you have correctly set the necessary parameters (see [Setting the motor data](#)).

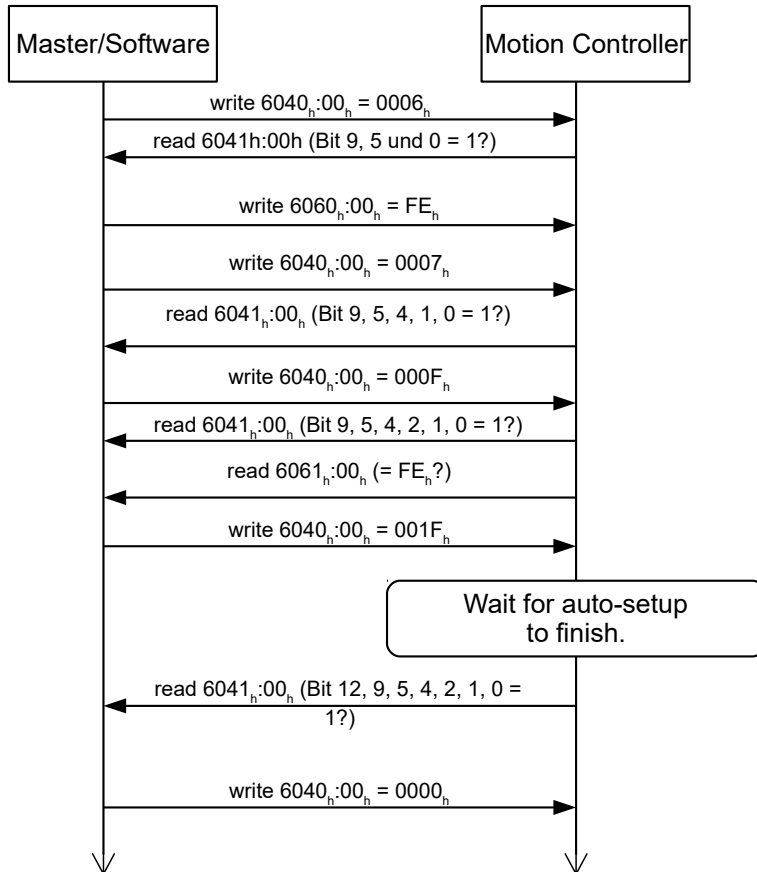

1. To preselect the *auto setup* operating mode, enter the value "-2" ("FE_h") in object 6060_h:00_h. The *power state machine* must now switch to the *Operation enabled* state, see [CiA 402 Power State Machine](#).
2. Start *auto setup* by setting bit 4 *OMS* in object 6040_h:00_h (controlword).

While the auto setup is running, the following tests and measurements are performed in succession:

1) To determine the values, the direction of the measurement method is reversed and edge detection re-evaluated.

Value 1 in bit 12 *OMS* in object 6041_h:00_h (statusword) indicates that the auto setup was completely executed and ended. In addition, bit 10 *TARG* in object 6041_h:00_h can be used to query whether (= "1") or not (= "0") an encoder index was found.

4.6.3 Parameter memory

After a successful *auto setup*, the determined parameter values are automatically taken over into the corresponding objects and stored with the storage mechanism, see [Saving objects](#) and [1010h Store Parameters](#). Categories *Drive* 1010h:05h and *Tuning* 1010h:06h are used.

CAUTION

Uncontrolled motor movements!

After the auto setup, the internal coordinate system is no longer valid. Unforeseen reactions can result.

- ▶ Restart the device after an auto setup. Homing alone does not suffice.

4.7 Configuring the sensors

The parameters (configuration, alignment, etc.) of each feedback are determined by [Auto setup](#) and stored in the following objects:

Object	Feedback	Description
3380h	Sensorless	Contains measurement and configuration values for sensorless control
3390h	Hall sensor (digital)	contains configuration values for the Hall sensors
33A0h	Incremental encoder 1	contains configuration values for the first incremental encoder

NOTE

It is not possible to determine the resolution of encoders without index or with more than one index per motor revolution.

In this case, you must enter and store the parameters in the corresponding objects (see [3204_h](#), [60E6_h](#) and [60EB_h](#)) (category *Tuning*, see [Saving objects](#)).

For external sensors that are not mounted directly on the motor shaft, you must set and store the gear ratio according to the constructive features (objects [60E8_h](#) and [60ED_h](#)) and/or the feed constant (objects [60E9_h](#) and [60EE_h](#)) (category *Application*).

Example

An encoder with a resolution of 2000 increments/mm was connected that is to be used in the field directly at the process for a high-precision position measurement. The constructive design was realized as follows:

Motor	Gearbox	Process	Encoder
Rotary	Rotary Rotary	Rotary Translational	Translational
1	i=4	Diameter 40 mm 125.6637... mm/ revolution	2000 incr./mm (62831.85 incr. per motor revolution)

You must set the resolution, gear ratio and feed constant as follows:

Object	Value
60E6_h Additional Position Encoder Resolution - Encoder Increments	1256637
60EB_h Additional Position Encoder Resolution - Motor Revolutions	20
60E8_h Additional Gear Ratio - Motor Shaft Revolutions	4
60ED_h Additional Gear Ratio - Driving Shaft Revolutions	1
60E9_h Additional Feed Constant - Feed	2513274 incr. (corresponds to 1256.637 mm)
60EE_h Additional Feed Constant - Driving Shaft Revolutions	10

You must still set the unit for the position to millimeters or other unit of length, see chapter [User-defined units](#).

In object [3203_h](#) you can set which of the present feedbacks the controller takes into account for each controller (current controller/commutation, velocity controller, position controller) in *closed loop* or the determination of the actual position and actual speed in *open loop*. See also chapter [Closed Loop](#) and [Assignment of the feedbacks to the control loops](#).

4.8 Test run

After configuring and the auto setup, a test run can be performed. As an example, the [Velocity](#) operating mode is used.

The values are transferred from your *CANopen master* or *Modbus master* to the controller. After every transfer, the *master* should use the status objects of the controller to ensure successful parameterization.

1. Select the *Velocity* mode by setting object 6060_h (Modes Of Operation) to the value "2".
2. Write the desired speed in 6042_h.
3. Switch the *power state machine* to the *Operation enabled* state, see CiA 402 Power State Machine.

The following sequence starts *Velocity* mode; the motor turns at 200 rpm.

4. To stop the motor, set controlword (6040_h) to "6".

5 General concepts

5.1 Control modes

5.1.1 General

The control mode of systems without feedback is called *open loop*, the mode with feedback is called *closed loop*. In the *closed loop* control mode, it is initially irrelevant whether the fed back signals come from the motor itself or from the influenced process.

For controllers with feedback, the measured control variable (actual value) is constantly compared with a set point (set value). In the event of deviations between these values, the controller readjusts according to the specified control parameters.

Pure controllers, on the other hand, have no feedback for the value that is to be regulated. The set point (set value) is only specified.

In addition to the physical feedback systems (e.g., via encoders or Hall sensors), model-based feedback systems, collectively referred to as *sensorless* systems, are also used. Both feedback systems can also be used in combination to further improve the control quality.

Summarized in the following are all possible combinations of control modes and feedback systems with respect to the motor technology. Support of the respective control mode and feedback is controller-specific and is described in chapters *Pin assignment* and *Operating modes*.

Control mode	Stepper motor	BLDC motor
Open Loop	yes	no
Closed Loop	yes	yes

Feedback	Stepper motor	BLDC motor
Hall	no	yes
Encoder	yes	yes

Feedback	Stepper motor	BLDC motor
Sensorless	yes	yes

Nanotec developed the *Slow Speed* control mode, which is a combination of *open loop* and *closed loop*, especially for applications in the low speed range. This control mode can be used if an encoder is present as feedback.

Various operating modes can be used depending on the control mode. The following list contains all the types of operation that are possible in the various control modes.

Operating mode	Control mode		
	Open Loop	Closed Loop	Slow Speed
Profile Position	yes	yes	yes
Velocity	yes	yes	yes
Profile Velocity	yes	yes	yes
Profile Torque	no ¹⁾	yes	no
Homing	yes ²⁾	yes	yes
Interpolated Position Mode	yes ³⁾	yes	yes
Cyclic Synchronous Position	yes ³⁾	yes	yes
Cyclic Synchronous Velocity	yes ³⁾	yes	yes
Cyclic Synchronous Torque	no ¹⁾	yes	no
Clock-direction	yes	yes	yes

1) The Profile Torque and Cyclic Synchronous Torque torque operating modes are not possible in the *open loop* control mode due to a lack of feedback.

2) Exception: Homing on block is not possible due to a lack of feedback.

3) Because ramps and speeds in operating modes Cyclic Synchronous Position and Cyclic Synchronous Velocity follow from the specified points of the master, it is not normally possible to preselect these parameters and to ascertain whether a step loss can be excluded. It is therefore not advisable to use these operating modes in combination with *open loop* control mode.

5.1.2 Open Loop

5.1.2.1 Introduction

Open loop mode is only used with stepper motors and is, by definition, a control mode without feedback. The field rotation in the stator is specified by the controller. The rotor directly follows the magnetic field rotation without step losses as long as no limit parameters, such as the maximum possible torque, are exceeded. Compared to *closed loop*, no complex internal control processes are needed in the controller. As a result, the requirements on the controller hardware and the controller logic are very low. *Open loop* mode is used primarily with price-sensitive applications and simple movement tasks.

Because, unlike *closed loop*, there is no feedback for the current rotor position, no conclusion can be drawn on the counter torque being applied to the output side of the motor shaft. To compensate for any torque fluctuations that arise on the output shaft of the motor, in *open loop* mode, the controller always supplies the maximum possible (e.g., specified by parameters) set current to the stator windings over the entire speed range. The high magnetic field strength thereby produced forces the rotor to assume the new steady state in a very short time. This torque is, however, opposite that of the inertia of the rotor and overall system. Under certain operating conditions, this combination is prone to resonances, comparable to a spring-mass system.

5.1.2.2 Commissioning

To use *open loop* mode, the following settings are necessary:

- In object 2030_h (Pole Pair Count), enter the number of pole pairs (see motor data sheet: for a stepper motor with 2 phases, a step angle of 1.8° corresponds to 50 pole pairs and 0.9° corresponds to 100 pole pairs).
- In object 2031_h:00_h, enter the maximum permissible motor current (motor protection) in mA (see motor data sheet)
- In object 6075_h:00_h, enter the rated current of the motor in mA (see motor data sheet).
- In object 6073_h:00_h, enter the maximum current (for a stepper motor, generally corresponds to the rated current, bipolar) in tenths of a percent of the set rated current (see motor data sheet). Factory settings: "1000", which corresponds to 100% of the value in 6073_h. A value greater than "1000" is limited internally to "1000".
- In object 3202_h (Motor Drive Submode Select), set bit 0 (CL/OL) to the value "0".

Nanotec recommends to activate the current reduction on motor standstill in order to reduce the power loss and heat build-up. To activate current reduction, the following settings are necessary:

- In object 3202_h (Motor Drive Submode Select), set bit 3 (CurRed) to "1".
- In object 2036_h (open-loop current reduction idle time), the time in milliseconds is specified that the motor must be at a standstill (set value is checked) before current reduction is activated.
- In object 2037_h (open-loop current reduction value/factor), the root mean square is specified to which the rated current is to be reduced if current reduction is activated in *open loop* and the motor is at a standstill.

5.1.2.3 Optimizations

Depending on the system, resonances may occur in *open loop* mode; susceptibility to resonances is particularly high at low loads. Practical experience has shown that, depending on the application, various measures are effective for largely reducing resonances:

- Reduce or increase current, see objects 6073_h and 6075_h, respectively. An excessive torque reserve promotes resonances.
- Reduce or increase the operating voltage, taking into account the product-specific ranges (with sufficient torque reserve). The permissible operating voltage range can be found in the product data sheet.
- Optimize the control parameters of the current controller via objects 3210_h:09_h (I_P) and 3210_h:0A_h (I_I) or 320E_h (generally not necessary).

The current controller operates optimally if the actual current of both windings (square root of the sum $I_a^2 + I_b^2$, 2039_h:03_h:04_h) divided by 2 at any point in time corresponds to the set rated current (203B_h:01_h).

- Adjustments to the acceleration, deceleration and/or target speed depending on the selected control mode:

Profile Position operating mode

Objects 6083_h (Profile Acceleration), 6084_h (Profile Deceleration) and 6081_h (Profile Velocity).

Velocity operating mode

Objects 6048_h (Velocity Acceleration), 6049_h (Velocity Deceleration) and 6042_h (Target Velocity).

Profile Velocity operating mode

Objects 6083_h (Profile Acceleration), 6084_h (Profile Deceleration) and 6081_h (Profile Velocity).

Homing operating mode

Objects 609A_h (Homing Acceleration), 6099_h:01_h (Speed During Search For Switch) and 6099_h:02_h (Speed During Search For Zero).

Interpolated Position Mode operating mode

The acceleration and deceleration ramps can be influenced with the higher-level controller.

Cyclic Synchronous Position operating mode

The acceleration and deceleration ramps can be influenced via the external "position specification / time unit" targets.

Cyclic Synchronous Velocity operating mode

The acceleration and deceleration ramps can be influenced via the external "position specification / time unit" targets.

Clock-direction operating mode

Change of the step resolution via objects 2057_h (Clock Direction Multiplier) and 2058_h (Clock Direction Divider). Optimize acceleration / deceleration ramps by adjusting the pulse frequency to pass through the resonance range as quickly as possible.

5.1.3 Closed Loop

5.1.3.1 Introduction

The *closed loop* theory is based on the idea of a control loop. A disturbance acting on a system should be compensated for quickly and without lasting deviation to adjust the control variable back to the set point.

Closed loop using a speed control as an example:

PI_I = Proportional-integral current control loop

PI_V = Proportional-integral velocity control loop

I_{actual} = Actual current

V_{actual} = Actual speed

The *closed loop* method is also referred to as "sine commutation via an encoder with field-oriented control". At the heart of *closed loop* technology is the performance-adjusted current control as well as the feedback of the actual values of the process. Using sensor signals, the rotor orientation is recorded and sinusoidal phase currents generated in the motor windings. Vector control of the magnetic field ensures that the magnetic field of the stator is always perpendicular to that of the rotor and that the field strength corresponds precisely to the desired torque. The current thereby controlled in the windings provides a uniform motor force and results in an especially smooth-running motor that can be precisely regulated.

The feedback of the control variables necessary for *closed loop* mode can be realized with various technologies. In addition to the physical feedback with encoders or Hall sensors, it is also possible to virtually record the motor parameters through a software-based model calculation. Physical variables, such as speed or back-EMF, can be reconstructed with the help of a so-called "observer" from the data of the current controller. With this sensorless technology, one has a "virtual rotary encoder", which – above a certain minimum speed – supplies the position and speed information with the same precision as a real optical or magnetic encoder.

All controllers from Nanotec that support *closed loop* mode implement a field oriented control with sine commutated current control. Thus, the stepper motors and BLDC motor are controlled in the same way as a servo motor. With *closed loop* mode, step angle errors can be compensated for during travel and load angle errors corrected within one full step.

5.1.3.2 Controller structure

The controller consists of three cascaded PI controllers (proportional-integral): the current controller (commutation), the velocity controller and the position controller.

The current controller is active in all operating modes. The velocity controller is as well with the sole exception of the "Real Torque" modes (torque mode without speed limiting if bit 5 in 3202_h is set to "1").

The position controller is active in the following operating modes:

- Profile Position
- Homing
- Interpolated Position Mode
- Cyclic Synchronous Position
- Clock-direction mode
- Velocity/Profile Velocity/Cyclic Synchronous Velocity if bit 1 in 3202_h is set to "1"

NOTE

For firmware versions from FIR-v19xx upwards, the new schema described here for the Controller structure applies.

The old control parameters (object 3210_h) are still activated in the factory settings for compatibility reasons. For new applications, Nanotec recommends using the new control parameters.

To use the new parameters, you must set $3210_h:07_h$ (for *closed loop*) or $3210_h:09_h$ (for *open loop*) to "0". When the controller is switched on, the old values are converted and entered in the new object $320E_h$ or $320F_h$. You must save both objects (see Saving objects).

Each controller consists of a proportional component with the *gain factor* K_p and an integral component with the *reset time* T_n . The control variable (the output signal of the controller, which is the set point for the next controller) is limited by the maximum speed (position controller), the maximum current (velocity controller) or the maximum PWM signal (current controller), respectively.

The following figures show the structure of the three cascaded controllers.

For each controller you can set a maximum control deviation (e_{max}) and a *gain factor* (K_p) that determine the output of the controller (control variable), taking into account the limitation of the control variable (y_{max}).

The following figure shows the relationship between the maximum control deviation (e), the control variable (y) and the *gain factor* (K_p) using the position controller as an example.

With a K_p of 100%, a maximum deviation set in 320E_h:04_h (e_{max_pos}) leads to the set maximum control variable set in 320E_h:05_h (in the case of the maximum speed, y_{max_vel}). For smaller deviations, the control variable is also correspondingly smaller.

The *gain factor* K_p has a direct influence on the current control variable: at the same deviation, the control variable is proportional to the gain factor.

Each controller also has an integral component that is determined by the *reset time* (T_n). The following figure shows the influence of the reset time on the control variable using the velocity controller as an example.

The smaller the reset time, the greater the influence of the integral component and the faster the control variable increases. If the reset time is 0, the integral component is internally set to "0" and the controller only has the proportional component.

5.1.3.3 Feed forward

It is also possible to set a *velocity feed forward*, an *acceleration feed forward* (that corresponds to a torque/current value) and a *voltage feed forward*.

You can use the *feed forward* to add an already known or anticipated control variable to the set point ("predictive"). You can, e. g., compensate for the inertia of the load by adding an acceleration feed forward value to the output of the velocity controller.

The feed forward values are additionally fed to the speed/current control loop or added to the voltage value and are immediately available. A more dynamic control can thereby be achieved.

The following figure shows the current (produced by the acceleration) during the acceleration phase as a function of the *acceleration feed forward*. At a feed forward value of "50%", the current is at "50%" already at the start of the acceleration phase; the current controller is thereby "relieved".

The factor for the *velocity feed forward* is set in object $320E_h:03_h$ in tenths of a percent of the output of the ramp generator ($606B_h$) and added to the output of the position controller before the velocity controller. The *velocity feed forward* is active in all modes with position control loop:

- Profile Position
- Homing
- Interpolated Position Mode
- Cyclic Synchronous Position
- Clock-direction mode
- Velocity/Profile Velocity if bit 1 in 3202_h is set to "1"

The factor for the *acceleration feed forward* is set in object $320E_h:08_h$ in tenths of a percent of the factor of $320D_h$ and multiplied by the output of the ramp generator (6074_h). The value is added to the output of the velocity controller before the current controller. The *acceleration feed forward* is active in all modes, with the exception of the torque modes.

The following figure shows the cases in which the feed forward is active and the position of the feed forward within the controller cascade.

The factor for the *voltage feed forward* is specified in object $320E_h:0D_h$ in tenths of a percent of the voltage that is needed to produce the rated current. If the factor is 1000‰ (factory setting), the voltage is immediately available and the actual current quickly reaches the rated current. As a result, there is practically no control deviation during acceleration and the current controller is relieved.

The *voltage feed forward* is active in all modes. To switch it off, set $320E_h:0D_h$ to "0".

5.1.3.4 Assignment of the feedbacks to the control loops

In object 3203_h , you define which of the existing feedbacks the controller takes into account for the individual controllers (current controller/commutation, velocity, position). You can also use a second sensor for the commutation (see [Commutation help](#)).

Each subindex of the object contains a bit mask for the respective feedback of a sensor. The bits have the following meaning here:

- Bit 0: If the bit is set to "1", this sensor is used for position feedback.
- Bit 1: If the bit is set to "1", this sensor is used for velocity feedback.
- Bit 2: If the bit is set to "1", this sensor is used for commutation feedback in [Closed Loop](#).

Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter [Configuring the sensors](#).

Which sensor the controller takes into account for the individual controllers (commutation, velocity, position) is implicitly specified by the order of the sensors.

The search always begins with sensor 2 and continues in ascending order until all existing sensors have been queried. If a sensor is found whose feedback is set, it is assigned to the corresponding controller and the search ended.

Example

The controller has two physical interfaces. Hall sensors and a (non-absolute) incremental encoder were connected.

Bit	Controller	Feedback 1 Sensorless	Feedback 2 Hall	Feedback 3 Incremental encoder
0	Position	0	0	1
1	Velocity	0	1	1 ¹
2	Commutation	0	1 ²	1
Index:Subindex		3203 _h :01 _h	3203 _h :02 _h	3203 _h :03 _h

¹The Hall sensors should be used for velocity control, the encoder for the positioning and commutation. Although the bit for the velocity was also set for the third feedback, this is not taken into account.

²Immediately after switching on – and until the index of the encoder is passed over for the first time – commutation is to take place via the Hall sensors and immediately enable *closed loop* mode.

Commutation help

Some sensors are initially lacking the alignment necessary for the commutation (offset between the index of the encoder and the magnets of the rotor). This means that the rotor orientation cannot be determined using only the position information of the sensor.

For assistance, you can set a second sensor as commutation sensor (bit 2 of the corresponding subindex in 3203_h). It is thereby possible, for example, for each (electric) absolute sensor with alignment (such as a Hall sensor), to offer commutation assistance, e. g., for an incremental encoder without index or still missing alignment (index signal not yet seen since a restart). The controller automatically uses the better sensor for the commutation.

If no second commutation sensor is selected or if the alignment is missing for the selected sensors, an auto-alignment is determined in *open loop* if necessary (independent of bit 4 in 3202_h).

5.1.3.5 Commissioning

An auto setup should be performed before using *closed loop* mode. The auto setup operating mode automatically determines the necessary parameters (e.g., motor data, feedback systems) that are necessary for optimum operation of the field oriented control. All information necessary for performing the auto setup can be found in chapter Auto setup.

To use *closed loop* mode, certain settings are necessary depending on the motor type and feedback; see chapter Setting the motor data.

Bit 0 in 3202_h must be set . The bit is set automatically after a successfully completed auto setup.

Activation

If an (electric) absolute sensor (e.g., Hall sensor) is used for the commutation, the *closed loop* is activated automatically already when switching on.

If an encoder is used for the commutation, the index of the encoder must be passed over at least once after switching on before *closed loop* can be activated (remains in *open loop* mode until this takes place).

If no index is present or if it cannot be used, you can:

- use a second sensor for commutation (see [Assignment of the feedbacks to the control loops](#))
- or have an *auto alignment* determined in *open loop* by setting bit 4 in `3202h` to "1".
Auto alignment is determined once every time the controller is restarted after the first command that switches the [CiA 402 Power State Machine](#) to the *Operation enabled* state.
 In doing so, the rotor is moved up to a magnetic pole. After the alignment has been determined, the *Operation enabled* state is reached and travel continues if applicable.

CAUTION

Uncontrolled motor movements!

Unforeseeable reactions can result if the alignment is not correctly determined.

Please observe the following requirements for the use of auto alignment:

- ▶ The motor shaft must ideally be load-free. If this is not possible, the motor must be designed so that there is a large torque reserve (at least 25%).
- ▶ Use an encoder with sufficiently high resolution (at least 500 counts per revolution, after quadrature, for a motor with 50 pole pairs)

Bit 15 in `6041h Statusword` indicates whether or not *closed loop* is active (if the state of [CiA 402 Power State Machine](#) is *Operation enabled*).

5.1.3.6 Optimizations

In *closed loop*, the measured control variable (actual value) is constantly compared with a set point (set value). In the event of deviations between these values, the controller readjusts according to the specified control parameters.

The objective of control parameter optimization (the so-called *tuning* of the controller) is the smoothest possible running of the motor, high accuracy and high dynamics in the reaction of the controller to faults. All control deviations should be eliminated as quickly as possible.

Due to the cascaded [Controller structure](#), it is useful to start the optimization of the inner-most controller (current controller) before the velocity and – if applicable – the position controller are optimized. Each of the three controllers consists of a proportional and an integral component, which should normally be adjusted in this order.

The following figures show the reaction of the controller to a change in set value.

If the proportional component is too small, the actual value remains below the set value. A proportional component that is too large, on the other hand, results in "overshooting".

If the reset time is too small, the system tends toward oscillations. If the reset time is too large, the deviations are compensated for too slowly.

CAUTION

Risk of injury through uncontrolled motor movements!

Incorrect control parameters may result in an unstable control behavior. Unforeseen reactions can result.

- ▶ Increase the control parameters slowly and incrementally. Do not increase these further if you notice strong vibrations/oscillations.
- ▶ Do not reach for moving parts during operation. After switching off, wait until all movements have ended.

5.1.4 Slow Speed

5.1.4.1 Introduction

The *slow speed* mode combines the advantages of *open loop* and *closed loop* technologies in a low speed range and can be used if an encoder is present as feedback. *Slow speed* offers following error monitoring but is more smooth-running than in pure *closed loop* mode at low speeds.

The rotor orientation is detected via the signals of the encoder. To calculate the speed, the change of position is divided by the (fixed) cycle time. At low speeds, the controller counts fewer (or even no) encoder increments in one cycle, which leads to a speed curve with a relatively high number of peaks (in spite of the used low-pass filter).

Due to the cascaded control loop, this results in current peaks in *closed loop* mode, which can lead to uneven running, as the following figure shows.

In the *slow speed* mode, the motor instead operates with constant phase current, as in *open loop*. The following error is, however, monitored by means of the encoder and the vector control of the magnetic field is activated if necessary, as in *closed loop*.

5.1.4.2 Activation

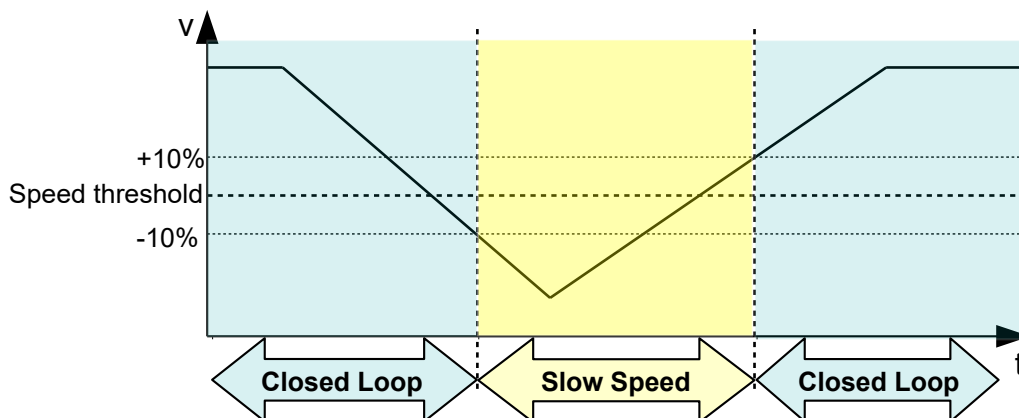

To activate the *slow speed* mode, you must:

1. activate closed loop,
2. in object `3202h` (Motor Drive Submode Select), set bit 7 to "1".

The changeover between *slow speed* and *closed loop* occurs automatically at a speed that is dependent on the physical encoder resolution, with a hysteresis of 10%. This fixed changeover speed is calculated in revolutions per minute as follows:

$$\frac{4000}{\text{Encoder resolution (ppr)}} \times 60$$

The following figure shows the changeover as a function of speed in both directions.

While at a standstill, the motor is in *closed loop* mode.

5.1.4.3 Optimizations

The entire phase current remains constant as in *open loop*. Depending on the system, resonances may occur that you can avoid by adjusting the motor current and/or the acceleration ramp. See also chapter [Open Loop](#).

During operation at various speed ranges, if changing between *closed loop* and *slow speed*, it may be necessary to:

- reduce the motor current (objects [6075_h](#), [6073_h](#)) if changing from *closed loop* to *slow speed*,
- ascertain various control parameters (see [Controller structure](#)) for each speed range.

5.2 CiA 402 Power State Machine

5.2.1 State machine

5.2.1.1 CiA 402

To switch the controller to the ready state, it is necessary to run through a *state machine*. This is defined in *CANopen standard 402*. State changes are requested in object [6040_h](#) (controlword). The actual state of the state machine can be found in object [6041_h](#) (statusword).

5.2.1.2 Controlword

State changes are requested via object [6040_h](#) (controlword).

State transitions

The diagram shows the possible state transitions.

Listed in the following table are the bit combinations for the controlword that result in the corresponding state transitions. An X here corresponds to a bit state that requires no further consideration. Exceptions are the resetting of the error (fault reset) and the changeover from *Quick Stop Active* to *Operation Enabled*: the transition is only requested by the rising edge of the bit.

Command	Bit in object 6040 _h					Transition
	Bit 7	Bit 3	Bit 2	Bit 1	Bit 0	
Shutdown	0	X	1	1	0	2, 6, 8
Switch on	0	0	1	1	1	3
Disable voltage	0	X	X	0	X	7, 10, 9, 12
Quick stop	0	X	0	1	X	11
Disable operation	0	0	1	1	1	5
Enable operation	0	1	1	1	1	4
Enable operation after Quick stop	0	1		1	1	16

Command	Bit in object 6040 _h					Transition
	Bit 7	Bit 3	Bit 2	Bit 1	Bit 0	
Fault / warning reset		X	X	X	X	15

5.2.1.3 Statusword

Listed in the following table are the bit masks that break down the state of the controller.

Statusword (6041 _h)	State
xxxx xxxx x0xx 0000	Not ready to switch on
xxxx xxxx x1xx 0000	Switch on disabled
xxxx xxxx x01x 0001	Ready to switch on
xxxx xxxx x01x 0011	Switched on
xxxx xxxx x01x 0111	Operation enabled
xxxx xxxx x00x 0111	Quick stop active
xxxx xxxx x0xx 1111	Fault reaction active
xxxx xxxx x0xx 1000	Fault

After switching on and successfully completing the self-test, the controller reaches the *Switch on disabled* state.

NOTE

If an unrecoverable error occurs, the controller changes to the *Not ready to switch on* state and remains there.

5.2.1.4 Operating mode

The operating mode is set in object 6060_h. The actually active operating mode is displayed in 6061_h.

The operating mode can be set or changed at any time.

5.2.2 Behavior upon exiting the *Operation enabled* state

5.2.2.1 Halt motion reactions

Various halt motion reactions can be programmed upon exiting the *Operation enabled* state.

The following graphic shows an overview of the halt motion reactions.

5.2.2.2 Quick stop active

Transition to the *Quick stop active* state (quick stop option):

In this case, the action stored in object 605A_n is executed (see following table).

Value in object 605A _n	Description
0	Immediate stop with subsequent state change to <i>Switch on disabled</i>
1	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Switch on disabled</i>
2	Braking with <i>quick stop ramp</i> (6085 _n) and subsequent state change to <i>Switch on disabled</i>
5	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Quick stop active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.

Value in object 605A _h	Description
6	Braking with <i>quick stop ramp</i> (6085 _h) and subsequent state change to <i>Quick Stop Active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.

The *Quick stop active* state can also be reached when a limit switch is actuated; see [Limitation of the range of motion](#).

5.2.2.3 Ready to switch on

Transition to the *Ready to switch on* state (shutdown option):

In this case, the action stored in object 605B_h is executed (see following table).

Value in object 605B _h	Description
-32768 ... -1	Reserved
0	Switch off driver without deceleration ramp; drive function blocked – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode) and subsequent state change to <i>Ready to switch on</i>
2 ... 32767	Reserved

5.2.2.4 Switched on

Transition to the *Switched on* state (disable operation option):

In this case, the action stored in object 605C_h is executed (see following table).

Value in object 605C _h	Description
-32768 ... -1	Reserved
0	Switch off driver without deceleration ramp; drive function blocked – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode) and subsequent state change to <i>Switched on</i>
2 ... 32767	Reserved

5.2.2.5 Halt

The bit is valid in the following modes:

- [Profile Position](#)
- [Velocity](#)
- [Profile Velocity](#)
- [Profile Torque](#)
- [Interpolated Position Mode](#)

When setting bit 8 in object 6040_h (controlword), the action stored in 605D_h is executed (see following table):

Value in object 605D _h	Description
-32768 ... 0	Reserved
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)

Value in object 605D _h	Description
2	Braking with <i>quick stop ramp</i> (6085 _h)
3 ... 32767	Reserved

5.2.2.6 Fault

Case of an error (fault):

If an error occurs, the motor will brake according to the value stored in object 605E_h.

Value in object 605E _h	Description
-32768 ... -1	Reserved
0	Switch off driver without deceleration ramp; drive function blocked – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (6085 _h)
3 ... 32767	Reserved

For each error that occurs, a more precise error code is stored in object 1003_h.

5.2.2.7 Following/slippage error

If a following or slippage error occurs, the motor is braked according to the value stored in object 3700_h.

Value	Description
-32768 ... -2	Reserved
-1	no reaction
0	Switch off driver without deceleration ramp; drive function blocked – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (6085 _h)
3 ... 32767	reserved

You can deactivate error monitoring by setting object 6065_h to the value "-1" (FFFFFFFF_h) or object 60F8_h to the value "7FFFFFFF_h".

5.3 User-defined units

The controller offers you the possibility to set user-defined units. It is thereby possible to set and read out the corresponding parameters, e.g., directly in degrees [°], millimeter [mm], etc.

Depending on the mechanical circumstances, you can also define a Gear ratio and/or a Feed constant.

NOTE

i Value changes of all objects that are described in this chapter are not immediately applied in the *Operation enabled* state of the CiA 402 Power State Machine. For this to happen, the *Operation enabled* state must be exited.

5.3.1 Units

Units of the international unit system (*SI*) as well as a number of specific units are supported. It is also possible to specify a power of ten as a factor.

Listed in the following table are all supported units for the position and their values for 60A8_h (Position unit) or 60A9_h (Speed unit). Depending on the unit that is used, Feed constant (6092_h) and/or Gear ratio (6091_h) are/is taken into account.

Name	Unit symbol	Value	6091 _h	6092 _h	Description
meter	m	01 _h	yes	yes	<i>Meter</i>
inch	in	C1 _h	yes	yes	<i>Inch</i> (=0.0254 m)
foot	ft	C2 _h	yes	yes	<i>Foot</i> (=0.3048 m)
grade	g	40 _h	yes	no	<i>Gradian</i> (unit of angle, 400 corresponds to 360°)
radian	rad	10 _h	yes	no	<i>Radian</i>
degree	°	41 _h	yes	no	<i>Degrees</i>
arcminute	'	42 _h	yes	no	<i>Arcminute</i> (60'=1°)
arcsecond	"	43 _h	yes	no	<i>Arcsecond</i> (60"=1')
mechanical revolution		B4 _h	yes	no	<i>Revolution</i>

Name	Unit symbol	Value	6091 _h	6092 _h	Description
encoder increment		B5 _h	no	no	<i>Encoder increments.</i> Dependent on the used sensor (encoder/Hall sensor) and <i>control mode</i> . In <i>open loop</i> and <i>sensorless mode</i> , the number of pole pairs (2030 _h) multiplied by 65536 corresponds to one motor revolution.
step		AC _h	no	no	<i>Steps.</i> With 2-phase stepper motors, the number of pole pairs (2030 _h) multiplied by 4 is equivalent to one revolution. With 3-phase BLDC motors, the number of pole pairs (2030 _h) multiplied by 6 is equivalent to one revolution.
electrical pole		C0 _h	no	no	<i>Electric poles.</i> With a stepper motor that has, e.g., 50 pole pairs (2030 _h), the unit corresponds to 1/50 of a revolution.
dimensionless		00 _h	yes	yes	<i>Dimensionless length unit</i>

Listed in the following table are all supported units for the time and their values for 60A9_h (*Speed unit*):

Name	Unit symbol	Value	Description
second	s	03 _h	<i>Second</i>
minute	min	47 _h	<i>Minute</i>
hour	h	48 _h	<i>Hour</i>
day	d	49 _h	<i>Day</i>
year	a	4A _h	<i>Year (=365.25 days)</i>

Listed in the following table are the possible exponents and their values for 60A8_h (*Position unit*) and 60A9_h (*Speed unit*):

Factor	Exponent	Value
10 ⁶	6	06 _h
10 ⁵	5	05 _h
...
10 ¹	1	01 _h
10 ⁰	0	00 _h
10 ⁻¹	-1	FF _h
...
10 ⁻⁵	-5	FB _h
10 ⁻⁶	-6	FA _h

5.3.2 Encoder resolution

The physical resolution for position measurement of the used encoder/sensor is calculated from the encoder increments (60E6_h (Encoder Increments)) per motor revolutions (60EB_h (Motor Revolutions)).

5.3.3 Gear ratio

The gear ratio is calculated from motor revolutions (60E8_h (Motor Shaft Revolutions)) per axis rotations (60ED_h (Driving Shaft Revolutions)).

5.3.4 Feed constant

The feed constant is calculated in user-defined position units from the feed ($60E9_h$ (Feed) per revolution of the output shaft ($60EE_h$ (Driving Shaft Revolutions)).

The feed constant is useful for specifying the lead screw pitch for a linear axis and is used if the unit is based on length dimensions or if it is dimensionless.

5.3.5 Calculation formulas for user units

5.3.5.1 Position unit

Object $60A8_h$ contains:

- Bits 16 to 23: The position unit (see chapter [Units](#))
- Bits 24 to 31: The exponent of a power of ten (see chapter [Units](#))

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Factor								Unit							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
reserved (00h)								reserved (00h)							

Example

If $60A8_h$ is written with the value "FF410000_h" (bits 16-23=41_h and bits 24-31=FF_h), the unit is set to *tenths of degree* (factory setting).

With a relative target position ($607A_h$) of 3600, the motor moves exactly one mechanical revolution, if [Gear ratio](#) is 1:1. The [Feed constant](#) plays no role in this case.

Example

If $60A8_h$ is written with the value "FD010000_h" (bits 16-23=01_h and bits 24-31=FD_h(=-3)), the unit is set to *millimeter*.

With a relative target position ($607A_h$) of 1, the motor moves exactly one mechanical revolution, if [Feed constant](#) and [Gear ratio](#) are 1:1.

If the [Feed constant](#) is set according to the lead screw pitch of a linear axis, the motor turns far enough that a feed of 1 mm is achieved.

Described in chapter [Assignment of the feedbacks to the control loops](#) is how you can determine which encoder/sensor is to be used for position control and measurement.

5.3.5.2 Speed unit

Object $60A9_h$ contains:

- Bits 8 to 15: The time unit (see chapter [Units](#))
- Bits 16 to 23: The position unit (see chapter [Units](#))
- Bits 24 to 31: The exponent of a power of ten (see chapter [Units](#))

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Factor								Nominator (Position)							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Denominator (Time)								reserved (00h)							

Example

If 60A9_h is written with the value "00B44700_h" (bits 8-15=00_h, bits 16-23=B4_h and bits 24-31=47_h), the unit is set to *revolutions per minute* (factory setting).

Example

If 60A9_h is written with the value "FD010300_h" (bits 8-15=FD_h(=-3), bits 16-23=01_h and bits 24-31=03_h), the unit is set to *millimeters per second*.

Described in chapter [Assignment of the feedbacks to the control loops](#) is how you can determine which encoder/sensor is to be used for speed control and measurement.

NOTE

The speed unit in Velocity mode is preset to *revolutions per minute*. You can only set the unit via the 604Ch VI Dimension Factor.

Conversion factor for the speed unit

You can set an additional factor for the speed unit. Thus, a unit of, e.g., 1/3 revolutions/minute is possible. The factor n is calculated from the factor for numerator (6096_h:01_h) divided by the factor for denominator (6096_h:02_h).

$$n_{\text{velocity}} = \frac{6096_{\text{h}}:01}{6096_{\text{h}}:02}$$

5.3.5.3 Acceleration unit

The acceleration unit is speed unit per second.

Conversion factor for the acceleration unit

The factor n for the acceleration unit is calculated from the numerator (6097_h:01_h) divided by the denominator (6097_h:02_h).

$$n_{\text{acceleration}} = \frac{6097_{\text{h}}:01}{6097_{\text{h}}:02}$$

5.3.5.4 Jerk unit

The jerk unit is Acceleration unit per second.

Conversion factor for jerk

The factor n for the jerk is calculated from the numerator (60A2_h:01_h) divided by the denominator (60A2_h:02_h).

$$n_{\text{jerk}} = \frac{60A2_{\text{h}}:01}{60A2_{\text{h}}:02}$$

5.4 Limitation of the range of motion

The digital inputs can be used as limit switches, as is described in chapter [Digital inputs](#), if you activate this function for the inputs. The controller also supports software limit switches.

5.4.1 Behavior upon reaching the limit switch

If a limit switch is passed over, bit 7 (*Warning*) is set in `6041h` (*statusword*) and the action that is stored in object `3701h` executed (see following table).

Value in object <code>3701_h</code>	Description
-1 (factory settings)	No reaction (e. g., to execute a homing operation)
1	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Switch on disabled</i>
2	Braking with <i>quick stop ramp</i> and subsequent state change to <i>Switch on disabled</i>
5	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Quick stop active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.
6	Braking with <i>quick stop ramp</i> and subsequent state change to <i>Quick Stop Active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.

As long as the limit switch is still active, travel in the direction of the limit switch is blocked; it is, however, possible to travel in the opposite direction.

Bit 7 (*Warning*) in `6041h` is not deleted until the limit switch is deactivated and the limit switch position has been passed back over.

NOTE

The quick-stop bit (bit 2) in `6040h` is not automatically set to "0" when the state changes to *Quick stop active*.

- ▶ If you want to change the *state machine* back to the *Operation enabled* state, you must set the bit to "0" and then to "1" again.

5.4.2 Software limit switches

The controller takes into account software limit switches (`607Dh` (Software Position Limit)). Target positions (`607Ah`) are limited by `607Dh`; the absolute target position may not be larger than the limits in `607Dh`. If the motor is located outside of the permissible range when setting up the limit switches, only travel commands in the direction of the permissible range are accepted.

5.5 Cycle times

The controller operates with a cycle time of 1 ms. This means that data are processed every 1 ms; multiple changes to a value (e.g., value of an object or level at a digital input) within one ms cannot be detected.

The following table includes an overview of the cycle times of the various processes.

Task	Cycle time
Application	1 ms
NanoJ application	1 ms

Task	Cycle time
Current controller	62.5 μ s (16 kHz)
Velocity controller	250 μ s (4 kHz)
Position controller	1 ms

6 Operating modes

6.1 Profile Position

6.1.1 Overview

6.1.1.1 Description

Profile Position Mode is used to move to positions relative to the last target position or to an absolute position (last reference position). During the movement, the limit values for the speed, starting acceleration/braking deceleration and jerks are taken into account.

6.1.1.2 Activation

To activate the mode, the value "1" must be set in object `6060h` (Modes Of Operation) (see "CiA 402 Power State Machine").

6.1.1.3 Controlword

The following bits in object `6040h` (controlword) have a special function:

- Bit 4 starts a travel command. This is carried out on a transition from "0" to "1". An exception occurs if changing from another operating mode to *profile position*: If bit 4 is already set, it does not need to be set to "0" and then back to "1" in order to start the travel command.
- Bit 5: If this bit is set to "1", a travel command triggered by bit 4 is immediately executed. If it is set to "0", the just executed travel command is completed and only then is the next travel command started.
- Bit 6: With "0", the target position (`607Ah`) is absolute and with "1" the target position is relative. The reference position is dependent on bits 0 and 1 of object `60F2h`.
- Bit 8 (Halt): If this bit is set to "1", the motor stops. On a transition from "1" to "0", the motor accelerates with the set start ramp to the target speed. On a transition from "0" to "1", the motor brakes and comes to a standstill. The braking deceleration is dependent here on the setting of the "Halt Option Code" in object `605Dh`.
- Bit 9 (Change on setpoint): If this bit is set, the speed is not changed until the first target position is reached. This means that, before the first target is reached, no braking is performed, as the motor should not come to a standstill at this position.

Controlword 6040 _h		
Bit 9	Bit 5	Definition
X	1	The new target position is moved to immediately.
0	0	Positioning is completed before moving to the next target position with the new limits.
1	0	The current target position is only passed through; afterwards, the new target position is moved to with the new values.

For further information, see figure in "Setting travel commands".

NOTE

Bit 9 in the controlword is ignored if the ramp speed is not met at the target point. In this case, the controller would need to reset and take a run-up to reach the preset.

6.1.1.4 Statusword

The following bits in object `6041h` (statusword) have a special function:

- Bit 10 (Target Reached): This bit is set to "1" if the last target was reached and the motor remains within a tolerance window (6067_h) for a preset time (6068_h). The bit is also set to "1" if the halt bit (bit 8) in 6040_h has been set and as soon as the motor is at a standstill.
- Bit 11: Limit exceeded: The demand position is above or below the limit values set in $607D_h$.
- Bit 12 (Set-point acknowledge): This bit confirms receipt of a new and valid set point. It is set and reset in sync with the "New set-point" bit in the controlword.

There is an exception in the event that a new movement is started before another one has completed and the next movement is not to occur until after the first one has finished. In this case, the bit is reset if the command was accepted and the controller is ready to execute new travel commands. If a new travel command is sent even though this bit is still set, the newest travel command is ignored.

The bit is not set if one of the following conditions is met:

- The new target position can no longer be reached while adhering to all boundary conditions.
- A target position was already traveled to and a target position was already specified. A new target position can only be specified after the current positioning has been concluded.
- Bit 13 (Following Error): This bit is set in *closed loop* mode if the following error is greater than the set limits (6065_h (Following Error Window) and 6066_h (Following Error Time Out)).

6.1.2 Setting travel commands

6.1.2.1 Travel command

In object $607A_h$ (Target Position), the new target position is specified in user units (see [User-defined units](#)). The travel command is then triggered by setting bit 4 in object 6040_h (controlword). If the target position is valid, the controller responds with bit 12 in object 6041_h (statusword) and begins the positioning move. As soon as the position is reached, bit 10 in the statusword is set to "1".

The controller can also reset bit 4 in object 6040_h (controlword) on its own. This is set with bits 4 and 5 of object $60F2_h$.

6.1.2.2 Other travel commands

Bit 12 in object 6041_h (statusword, set-point acknowledge) changes to "0" if another travel command can be buffered (see time 1 in the following figure). As long as a target position is being moved to, a second target position can be passed to the controller in preparation. All parameters – such as speed, acceleration, braking

deceleration, etc. – can thereby be reset (time 2). If the buffer is empty, the next time can be queued up (time 3).

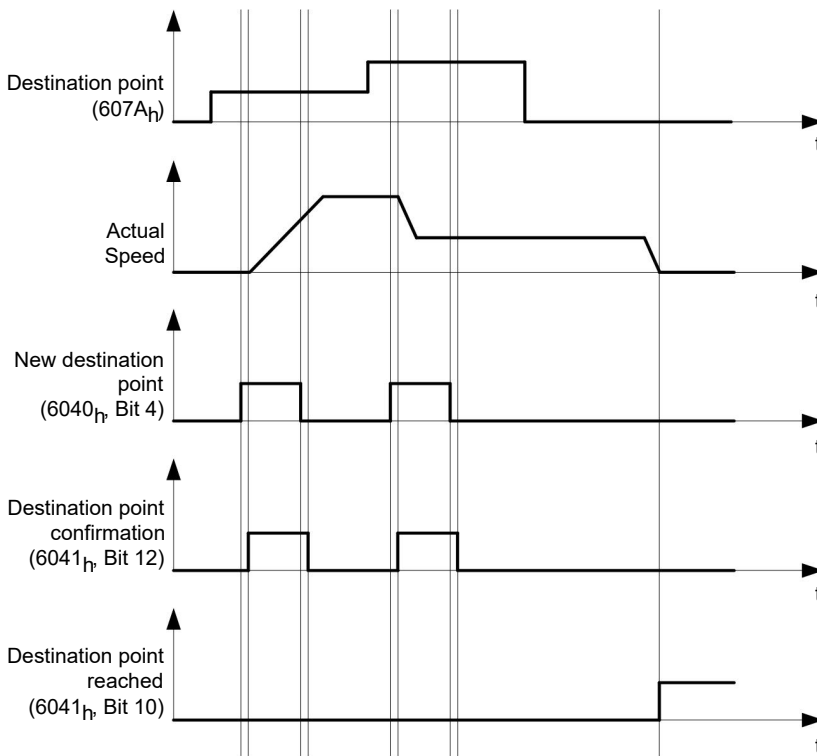

If the buffer is already full, a new set point is ignored (time 4). If bit 5 in object 6040_h (controlword, bit: "Change Set-Point Immediately") is set, the controller operates without the buffer; new travel commands are implemented directly (time 5).

Times

Transition procedure for second target position

The following graphic shows the transition procedure for the second target position while moving to the first target position. In this figure, bit 5 of object 6040_h (controlword) is set to "1"; the new target value is, thus, taken over immediately.

Possibilities for moving to a target position

If bit 9 in object 6040_h (controlword) is equal to "0", the current target position is first moved to completely. In this example, the final speed (6082_h) of the target position is equal to zero. If bit 9 is set to "1", the profile speed (6081_h) is maintained until the target position is reached; only then do the new boundary conditions apply.

Possible combinations of travel commands

To provide a better overview of the travel commands, combinations of travel commands are listed and depicted in this chapter.

The following applies for the figures below:

- A double arrow indicates a new travel command.
- The first travel command at the start is always an absolute travel command to position 1100.
- The second movement is performed at a lower speed so as to present the graphs in a clear manner.

- Change on setpoint ($6040_h;00$ Bit 5 = 0)
- Move absolute ($6040_h;00$ Bit 6 = 0)
- Target position: 300

- Relative to the preceding target position ($60F2_n;00 = 0$)
- Change on setpoint ($6040_h;00$ Bit 5 = 0)
- Move relative ($6040_h;00$ Bit 6 = 1)
- Target position: 300

- Change set immediately ($6040_h;00$ Bit 5 = 1)
- Move absolute ($6040_h;00$ Bit 6 = 0)
- Target position: 300

- Relative to the preceding target position ($60F2_n;00 = 0$)
- Change set immediately ($6040_h;00$ Bit 5 = 1)
- Move relative ($6040_h;00$ Bit 6 = 1)
- Target position: 300

- Change on setpoint (6040_h:00 Bit 5 = 0)
- Move absolute (6040_h:00 Bit 6 = 0)
- Target position: 300

- Relative to the actual position (60F2_h:00 = 1)
- Change on setpoint (6040_h:00 Bit 5 = 0)
- Move relative (6040_h:00 Bit 6 = 1)
- Target position: 300

- Change set immediately (6040_h:00 Bit 5 = 1)
- Move absolute (6040_h:00 Bit 6 = 0)
- Target position: 300

6.1.3 Loss of accuracy for relative movements

When linking together relative movements, a loss of accuracy may occur if the final speed is not set to zero. The following graphic illustrates the reason.

The current position is sampled once per millisecond. It is possible that the target position is reached between two samples. If the final speed is not equal to zero, then, after the target position is reached, the sample is used as an offset as the basis for the subsequent movement. As a result, the subsequent movement may go somewhat farther than expected.

6.1.4 Boundary conditions for a positioning move

6.1.4.1 Object entries

The boundary conditions for the position that has been moved to can be set in the following entries of the object dictionary:

- **607A_h**: (Target Position): Planned target position
- **607D_h**: (Software Position Limit): Definition of the limit stops (see chapter [Software limit switches](#))
- **607C_h**: (Home Offset): Specifies the difference between the zero position of the controller and the reference point of the machine in user-defined units. (See "[Homing](#)")
- **607B_h**: (Position Range Limit): Limits of a modulo operation for replicating an endless rotation axis
- **607_h**: (Polarity): Direction of rotation
- **6081_h**: (Profile Velocity): Maximum speed with which the position is to be approached
- **6082_h**: (End Velocity): Speed upon reaching the target position
- **6083_h**: (Profile Acceleration): Desired starting acceleration
- **6084_h**: (Profile Deceleration): Desired braking deceleration
- **6085_h**: (Quick Stop Deceleration): Emergency-stop braking deceleration in case of the "Quick stop active" state of the "CiA 402 Power State Machine"
- **6086_h**: (Motion Profile Type): Type of ramp to be traveled; if the value is "0", the jerk is not limited; if the value is "3", the values of 60A4_h:1_h–4_h are set as limits for the jerk.
- **60C5_h**: (Max Acceleration): The maximum acceleration that may not be exceeded when moving to the end position
- **60C6_h**: (Max Deceleration): The maximum braking deceleration that may not be exceeded when moving to the end position
- **60A4_h**: (Profile Jerk), subindex 01_h to 04_h: Objects for specifying the limit values for the jerk.
- The speed is limited by **607E_h** (Max Profile Velocity) and **6080_h** (Max Motor Speed); the smaller value is used as the limit.
- **60F2_h**: (Positioning Option Code): Defines the positioning behavior

6.1.4.2 Objects for the positioning move

The following graphic shows the objects involved in the boundary conditions of the positioning move.

6.1.4.3 Parameters for the target position

The following graphic shows an overview of the parameters that are used for moving to a target position (figure not to scale).

6.1.5 Jerk-limited mode and non-jerk-limited mode

6.1.5.1 Description

A distinction is made between the "jerk-limited" and "non-jerk-limited" modes.

6.1.5.2 Jerk-limited mode

Jerk-limited positioning can be achieved by setting object 6086_h to "3". The entries for the jerks in subindices :1_h–4_h of object 60A4 thereby become valid.

6.1.5.3 Non-jerk-limited mode

A "non-jerk-limited" ramp is traveled if the entry in object 6086_h is set to "0" (default setting).

6.2 Velocity

6.2.1 Description

This mode operates the motor at a preset target speed, similar to a frequency inverter. Unlike the *profile velocity mode*, this mode does not permit the selection of jerk-limited ramps.

6.2.2 Activation

To activate the mode, the value "2" must be set in object 6060_h (Modes Of Operation) (see "CiA 402 Power State Machine").

6.2.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

- Bit 8 (Halt): If this bit is set to "1", the motor stops. On a transition from "1" to "0", the motor accelerates with the acceleration ramp to the target speed. On a transition from "0" to "1", the motor brakes according to the deceleration ramp and comes to a standstill.

6.2.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

- Bit 11: Limit exceeded: The target speed is above or below the set limit values.

6.2.5 Object entries

The following objects are necessary for controlling this mode:

- 604C_h (Dimension Factor):
The unit for speed values is defined here for the following objects.
Subindex 1 contains the denominator (multiplier) and subindex 2 contains the numerator (divisor) with which the internal speed values are converted to revolutions per minute. If, for example, subindex 1 is set to the value "60" and subindex 2 is set to the value "1", the speed is specified in revolutions per second (60 revolutions per 1 minute).
- 6042_h: Target Velocity.
The target speed is set here in user-defined units.
- 6048_h: Velocity Acceleration
This object defines the acceleration. Subindex 1 contains the change in speed, subindex 2 the corresponding time in seconds. Both together are used to calculate the acceleration:

$$\text{VL velocity acceleration} = \frac{\text{Delta speed (6048}_{h}:1)}{\text{Delta time (6048}_{h}:2)}$$

- 6049_h (Velocity Deceleration):
This object defines the deceleration (deceleration ramp). The subindices here are arranged as described in object 6048_h; the change in speed is to be specified with positive sign.
- 6046_h (Velocity Min Max Amount):
The limitations of the target speeds are specified in this object.
The minimum speed is set in 6046_h:1_h. If the target speed (6042_h) falls below the minimum speed, the value is limited to the minimum speed 6046_h:1_h.
The maximum speed is set in 6046_h:2_h. If the target speed (6042_h) exceeds the maximum speed, the value is limited to the maximum speed 6046_h:2_h.
- 604A_h (Velocity Quick Stop):
This object can be used to set the quick-stop ramp. Subindices 1 and 2 are identical to those described for object 6048_h.

The following objects can be used to check the function:

- 6043_h (VI Velocity Demand)
- 6044_h (VI Velocity Actual Value)

6.2.5.1 Speeds in Velocity Mode

6.2.5.2 Objects for Velocity Mode

The ramp generator follows the target speed, remaining within the set speed and acceleration limits. As long as a limit is active, bit 11 in object 6041_h is set (internal limit active).

6.3 Profile Velocity

6.3.1 Description

This mode operates the motor in Velocity Mode with extended (jerk-limited) ramps. Unlike *Velocity Mode* (see "Velocity"), the statusword is used in this mode to indicate whether the target speed is reached.

6.3.2 Activation

To activate the mode, the value "3" must be set in object 6060_h (Modes Of Operation) (see "CiA 402 Power State Machine").

6.3.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

- Bit 8 (Halt): If this bit is set to "1", the motor stops. On a transition from "1" to "0", the motor accelerates with the set start ramp to the target speed. On a transition from "0" to "1", the motor brakes and comes to a standstill.

6.3.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

- Bit 10 (target speed reached; Target Reached): In combination with bit 8 in the controlword, this bit specifies whether the target speed is reached, if braking is taking place or if the motor is at a standstill (see table).

6041 _h Bit 10	6040 _h Bit 8	Description
0	0	Target speed not reached
0	1	Axis braking
1	0	Target speed within target window (defined in 606D _h and 606E _h)
1	1	Axis speed is 0

- Bit 12: This bit indicates whether the actual speed is zero.
If the actual speed is greater than the value in 606F_h(Velocity Threshold) for a time of 6070_h(Velocity Threshold Time), this bit has the value "0". The bit otherwise remains set to "1".
- Bit 13 (Deviation Error): This bit is set in *closed loop* mode if the slippage error is greater than the set limits (60F8_h Max Slippage and 203F_h Max Slippage Time Out).

6.3.5 Object entries

The following objects are necessary for controlling this mode:

- 606B_h (Velocity Demand Value):
This object contains the output of the ramp generator, which simultaneously serves as the preset value for the velocity controller.
- 606C_h (Velocity Actual Value):
Indicates the current actual speed.
- 606D_h (Velocity Window):
This value specifies by how much the actual speed may vary from the set speed for bit 10 (target speed reached; Target Reached") in object 6041_h (statusword) to be set to "1".
- 606E_h (Velocity Window Time):
This object specifies how long the actual speed and the set speed must be close to one another (see 606D_h "Velocity Window") for bit 10 "Target speed reached" in object 6041_h (statusword) to be set to "1".
- 607E_h (Polarity):
If bit 6 is set to "1" here, the sign of the target speed is reversed.
- 6083_h (Profile acceleration):
Sets the value for the acceleration ramp.
- 6084_h (Profile Deceleration):
Sets the value for the deceleration ramp.
- 6085_h (Quick Stop Deceleration):
Sets the value for the deceleration ramp for rapid braking.
- 6086_h (Motion Profile Type):
The ramp type can be selected here ("0" = trapezoidal ramp, "3" = jerk-limited ramp).
- 60FF_h (Target Velocity):
Specifies the target speed that is to be reached.
- The speed is limited by 607E_h (Max Profile Velocity) and 6080_h (Max Motor Speed); the smaller value is used as the limit.

6.3.5.1 Objects in Profile Velocity Mode

6.3.5.2 Activation

After the mode is selected in object 6060_h (Modes Of Operation) and the "Power State machine" (see "CiA 402 Power State Machine") is switched to *Operation enabled*, the motor is accelerated to the target speed in object 60FF_h (see following figures). The speed and acceleration values are taken into account here; for jerk-limited ramps, the jerk-limit values are also taken into account.

6.3.5.3 Limitations in the jerk-limited case

The following figure shows the adjustable limits in the jerk-limited case (6086_h = 3).

6.3.5.4 Limitations in the trapezoidal case

This figure shows the adjustable limitations for the trapezoidal case ($6086_h = 0$).

6.4 Profile Torque

6.4.1 Description

In this mode, the torque is preset as a set value and reached via a ramp function.

NOTE

This mode only functions if closed loop is activated, see also Commissioning Closed Loop.

6.4.2 Activation

To activate the mode, the value "4" must be set in object 6060_h (Modes Of Operation) (see "CiA 402 Power State Machine").

6.4.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

- Bit 8 (Halt): If this bit is set to "1", the motor stops. If this bit is set from "1" to "0", the motor is started up according to the presets. When setting from "0" to "1", the motor is again brought to a standstill, taking the preset values into consideration.

6.4.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

- Bit 10 (Target Reached): In combination with bit 8 of object 6040_h (controlword), this bit indicates whether the specified torque is reached (see following table). The target is considered having been met if the current torque (6077_h Torque Actual Value) is within a tolerance window ($203D_h$ Torque Window) for a specified time ($203E_h$ Torque Window Time Out).

6040_h Bit 8	6041_h Bit 10	Description
0	0	Specified torque not reached

6040 _h Bit 8	6041 _h Bit 10	Description
0	1	Specified torque reached
1	0	Axis brakes
1	1	Axis speed is 0

- Bit 11: Limit exceeded: The target torque (6071_h) exceeds the maximum torque entered in 6072_h.

6.4.5 Object entries

All values of the following entries in the object dictionary are to be specified as a thousandth of the maximum torque, which corresponds to the rated current (203B_h:01_h). This includes the objects:

- 6071_h (Target Torque):
Target torque
- 6072_h (Max Torque):
Maximum torque during the entire ramp (accelerate, maintain torque, decelerate)
- 6073_h (Max Current):
Maximum current. The minimum of 6073_h and 6072_h is used as limit for the torque in 6071_h.
- 6074_h (Torque Demand):
Current output value of the ramp generator (torque) for the controller
- 6087_h (Torque Slope):
Max. change in torque per second

NOTE

These values are not limited to 100% of the rated current (203B_h:01_h). Torque values greater than the rated torque (generated from the rated current) can be achieved if the maximum duration (203B_h:02_h) of the maximum current (6073_h) is set (see [I2t Motor overload protection](#)). All torque objects are limited by the maximum motor current (2031_h).

The following objects are also needed for this operating mode:

- 3202_h Bit 5 (Motor Drive Submode Select):
If this bit is set to "0", the drive controller is operated in the torque-limited Velocity Mode, i.e., the maximum speed can be limited in object 6080_h and the controller can operate in field weakening mode.
If this bit is set to "1", the controller operates in the ("Real") Torque Mode; the maximum speed cannot be limited here and field weakening mode is not possible.

6.4.5.1 Objects of the ramp generator

6.4.5.2 Torque curve

6.5 Homing

6.5.1 Overview

6.5.1.1 Description

The purpose of the homing method is to align the position zero point of the controller with an encoder index or position switch.

6.5.1.2 Activation

To activate the mode, the value "6" must be set in object 6060_h (Modes Of Operation) (see "[CiA 402 Power State Machine](#)").

TIP

If home switches and/or limit switches are used, these special functions must first be activated in the I/O configuration (see "[Digital inputs and outputs](#)").

To use the limit switch, you must also set object 3701_h to "-1" (factory setting) to prevent blocking the further travel of the motor.

6.5.1.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

- Bit 4: If the bit is set to "1", referencing is started. This is performed until either the reference position is reached or bit 4 is reset to "0".

6.5.1.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

Bit 13	Bit 12	Bit 10	Description
0	0	0	Homing is performed
0	0	1	Homing is interrupted or not started
0	1	0	Homing has been performed since the last restart but target is not currently reached
0	1	1	Homing completed
1	0	0	Error during homing, motor still turning
1	0	1	Error during homing, motor at standstill

NOTE

Bit 12 in *Homing* mode is set to 1 after the first fully completed homing operation since the restart. It is only reset to 0

- during all subsequent homing operations
- in the event of an error during a homing operation (permanently deleted until a new homing operation is fully completed).

6.5.1.5 Object entries

The following objects are necessary for controlling this mode:

- $607C_h$ (Home Offset): Specifies the difference between the zero position of the controller and the reference point of the machine in user-defined units.
- 6098_h (Homing Method): Method to be used for referencing (see "Homing method")
- $6099_h:01_h$ (Speed During Search For Switch): Speed for the search of the switch
- $6099_h:02_h$ (Speed During Search For Zero): Speed for the search of the index
- 6080_h (Max Motor Speed): Maximum speed
- $609A_h$ (Homing Acceleration): Starting acceleration and braking deceleration for homing
- $203A_h:01_h$ (Minimum Current For Block Detection): Minimum current threshold which, if exceeded, is to detect the blocking of the motor at a block.
- $203A_h:02_h$ (Period Of Blocking): Specifies the time in ms that the motor is to continue to run against the block after block detection.

Homing speeds

The figure shows the homing speeds using method 4 as an example:

6.5.2 Homing method

6.5.2.1 Description

The homing method is written as a number in object 6098_h and decides whether, on a switch edge (rising/falling), a current threshold for block detection or an index pulse is referenced or in which direction homing starts. Methods that use the index pulse of the encoder lie in the number range 1 to 14, 33 and 34. Methods that do not use the index pulse of the encoder lie between 17 and 30, but are identical to methods 1 to 14 with respect to the travel profiles. These number are shown in circles in the following figures. Methods for which no limit switches are used and, instead, travel against a block is to be detected, a minus must be placed before the method number when making the call.

In the following graphics, the negative movement direction is to the left. The *limit switch* is located before the respective mechanical block; the *home switch* is located between the two limit switches. The index pulses come from the connected encoder.

For methods that use homing on block, the same figures apply as for the methods with limit switch. Because nothing is different aside from the missing limit switches, the same figures are used. For the figures here, the limit switches must be replaced with a mechanical block.

6.5.2.2 Homing on block

Homing on block currently only functions in *closed loop* mode.

"Homing on block" functions like every homing method with the difference that instead of a limit switch, a block (limit stop) is used for positioning. Two settings are to be made here:

1. Current level: In object $203A_h:01$, the current level is defined above which movement against the block is detected.
2. Blocking duration: In object $203A_h:02$, the duration during which the motor moves against the block is set.

6.5.2.3 Overview of methods

Methods 1 to 14 as well as 33 and 34 use the index pulse of the encoder.

Methods 17 to 32 are identical to methods 1 to 14 with the difference that only limit or home switches are used for referencing and not the index pulse.

- Methods 1 to 14 use an index pulse.
- Methods 17 to 30 do not use an index pulse.
- Methods 33 and 34 reference only to the next index pulse.
- Method 35 references to the current position.

The following methods can be used for homing on block:

- Methods -1 to -2 and -7 to -14 contain an index pulse
- Methods -17 to -18 and -23 to -30 have no index pulse

6.5.2.4 Methods 1 and 2

Reference to limit switches and index pulse.

Method 1 references to negative limit switch and index pulse:

Method 2 references to positive limit switch and index pulse:

6.5.2.5 Methods 3 to 6

Reference to the switching edge of the home switch and index pulse.

With methods 3 and 4, the left switching edge of the home switch is used as reference:

With methods 5 and 6, the right switching edge of the home switch is used as reference:

6.5.2.6 Methods 7 to 14

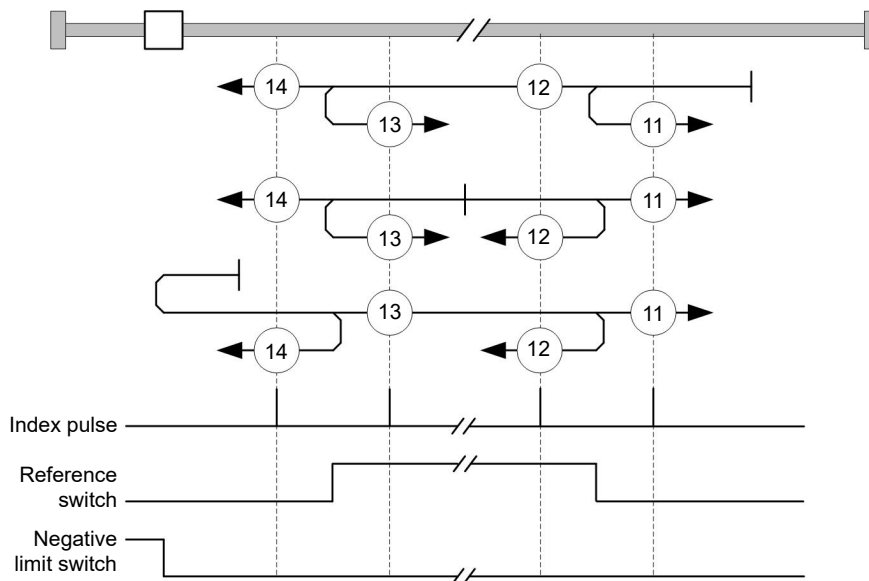

Reference to the home switch and index pulse (with limit switches).

With these methods, the current position relative to the home switch is not important. With method 10, for example, referencing is always performed to the index pulse to the right of the right edge of the home switch.

Methods 7 to 10 take the positive limit switch into account:

Methods 11 to 14 take the negative limit switch into account:

6.5.2.7 Methods 17 and 18

Reference to the limit switch without the index pulse.

Method 17 references to the negative limit switch:

Method 18 references to the positive limit switch:

6.5.2.8 Methods 19 to 22

Reference to the switching edge of the home switch without the index pulse.

With methods 19 and 20 (equivalent to methods 3 and 4), the left switching edge of the home switch is used as reference:

With methods 21 and 22 (equivalent to methods 5 and 6), the right switching edge of the home switch is used as reference:

6.5.2.9 Methods 23 to 30

Reference to the home switch without the index pulse (with limit switches).

With these methods, the current position relative to the home switch is not important. With method 26, for example, referencing is always performed to the index pulse to the right of the right edge of the home switch.

Methods 23 to 26 take the positive home switch into account:

Methods 27 to 30 take the negative home switch into account:

6.5.2.10 Methods 33 and 34

Reference to the next index pulse.

With these methods referencing is only performed to the respective subsequent index pulse:

6.5.2.11 Method 35

References to the current position.

NOTE

For homing mode 35, it is not necessary to switch the CiA 402 Power State Machine to the "Operation enabled" state. When energizing the motor windings in *open loop* mode, it is thereby possible to prevent the current position from not being exactly 0 after Homing Mode 35.

6.6 Interpolated Position Mode

6.6.1 Overview

6.6.1.1 Description

Interpolated position mode is used to synchronize multiple axes. For this purpose, a higher-level controller performs the ramp and path calculation and passes the respective demand position, at which the axis is to be located at a certain time, to the controller. The controller interpolates between these intermediate position points.

6.6.1.2 Synchronization with the SYNC object

For interpolated position mode, it is necessary that the controller synchronizes with the SYNC object (depending on the fieldbus). This SYNC object is to be sent by the higher-level controller in regular intervals. Synchronization occurs as soon as the controller is switched to the *Operational* NMT mode.

NOTE

Where possible, it is recommended that a time interval of the *SYNC object* be used.

6.6.2 Activation

To activate the mode, the value "7" must be set in object 6060_h (Modes Of Operation) (see "CiA 402 Power State Machine").

6.6.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

- Bit 4 activates the interpolation when it is set to "1".
- Bit 8 (Halt): If this bit is set to "1", the motor stops. On a transition from "1" to "0", the motor accelerates with the set start ramp to the target speed. On a transition from "0" to "1", the motor brakes and comes to a standstill. The braking deceleration is dependent here on the setting of the "Halt Option Code" in object 605D_h.

6.6.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

- Bit 10: Target position reached: This bit is set to "1" if the target position was reached (if the halt bit in the controlword is "0") or the axis has speed 0 (if the halt bit in the last control word was "1").
- Bit 12 (IP mode active): This bit is set to "1" if interpolation is active.
- Bit 13 (Following Error): This bit is set in *closed loop* mode if the following error is greater than the set limits (6065_h (Following Error Window) and 6066_h (Following Error Time Out)).

6.6.5 Use

The controller follows a linearly interpolated path between the current position and the preset target position. The (next) target position must be written in record 60C1_h:01_h.

In the current implementation, only

- linear interpolation
- and a target position

are supported.

6.6.6 Setup

The following setup is necessary:

- `60C2h:01h`: Time between two passed target positions in ms.
- `60C4h:06h`: This object is to be set to "1" to be able to modify the target position in object `60C1h:01h`.
- `6081h` (Profile Velocity): Maximum speed with which the position is to be approached
- `6084h` (Profile Deceleration): Desired braking deceleration during braking
- `60C6h`: (Max Deceleration): The maximum allowed braking deceleration
- Only if closed loop is activated: The speed is limited by `607Fh` (Max Profile Velocity) and `6080h` (Max Motor Speed); the smaller value is used as the limit.
- To be able to turn the motor, the *power state machine* is to be set to the *Operation enabled* state (see CiA 402 Power State Machine).

6.6.7 Operation

After setting up, the task of the higher-level controller is to write the target positions to object `60C1h:01h` in time.

6.7 Cyclic Synchronous Position

6.7.1 Overview

6.7.1.1 Description

In this mode, the controller receives an absolute position preset via the fieldbus at fixed time intervals (referred to in the following as a *cycle*). The controller then no longer calculates any ramps, but rather only follows the presets.

The target position is transferred cyclically (via *PDO*). Bit 4 in the controlword does not need to be set (unlike the Profile Position mode).

NOTE

The target is absolute and, thus, independent of how often it was sent per *cycle*.

6.7.1.2 Synchronization with the SYNC object

To achieve smooth movement, the controller should synchronize with the SYNC object (depending on the field bus). This SYNC object is to be sent by the higher-level controller in regular intervals. Synchronization occurs as soon as the controller is switched to the *Operational* NMT mode.

NOTE

Where possible, it is recommended that a time interval of the *SYNC object* be used for transfer of the target position.

6.7.1.3 Activation

To activate the mode, the value "8" must be set in object 6060_h (Modes Of Operation) (see "CiA 402 Power State Machine").

6.7.1.4 Controlword

In this mode, the bits of controlword 6040_h have no special function.

6.7.1.5 Statusword

The following bits in object 6041_h (statusword) have a special function:

Bit	Value	Description
8	0	The controller is not in sync with the fieldbus
8	1	The controller is in sync with the fieldbus
10	0	Reserved
10	1	Reserved
12	0	Controller does not follow the target; the preset of <u>607A_h</u> (Target Position) is ignored
12	1	Controller follows the target; object <u>607A_h</u> (Target Position) is used as the input for position control.
13	0	No following error
13	1	Following error

Bit 11: Limit exceeded: The demand position is above or below the limit values set in 607D_h.

6.7.2 Object entries

The following objects are necessary for controlling this mode:

- 607A_h (Target Position): This object must be written cyclically with the position set value.
- 607B_h (Position Range Limit): This object contains the preset for an overrun or underrun of the position specification.
- 607D_h (Software Position Limit): This object defines the limitations within which the position specification (607A_h) must be located.
- 6065_h (Following Error Window): This object specifies a tolerance corridor in both the positive and negative direction from the set specification. If the actual position is outside of this corridor for longer than the specified time (6066_h), a following error is reported.
- 6066_h (Following Error Time Out): This object specifies the time range in milliseconds. If the actual position is outside of the position corridor (6065_h) for longer than this time range, a following error is triggered.
- 6085_h (Quick-Stop Deceleration): This object contains the braking deceleration for the case that a quick-stop is triggered.

- **605A_h** (Quick-Stop Option Code): This object contains the option that is to be executed in the event of a quick-stop.
- Only if closed loop is activated: **6080_h** (Max Motor Speed): Maximum speed
- **60C2_h:01_h** (Interpolation Time Period): This object specifies the time of a *cycle*; a new set value must be written in **607A_h** in these time intervals.
The following applies here: cycle time = value of **60C2_h:01_h** * 10^{value of 60C2:02} seconds.
- **60C2_h:02_h** (Interpolation Time Index): This object specifies the time basis of the cycles. Currently, only value **60C2_h:02_h=-3** is supported; this yields a time basis of 1 millisecond.
- **60B0_h** (Position Offset): Offset for the position set value in user-defined units
- **60B1_h** (Velocity Offset): Offset for the speed set value in user-defined units
- **60B2_h** (Torque Offset): Offset for the torque set value in tenths of a percent

The following objects can be read in this mode:

- **6064_h** (Position Actual Value)
- **606C_h** (Velocity Actual Value)
- **60F4_h** (Following Error Actual Value)

6.8 Cyclic Synchronous Velocity

6.8.1 Overview

6.8.1.1 Description

In this mode, the controller passes a speed preset via the fieldbus at fixed time intervals (referred to in the following as a *cycle*). The controller then no longer calculates any ramps, but rather only follows the presets.

6.8.1.2 Activation

To activate the mode, the value "9" must be set in object **6060_h** (Modes Of Operation) (see "CiA 402 Power State Machine").

6.8.1.3 Controlword

In this mode, the bits of controlword **6040_h** have no special function.

6.8.1.4 Statusword

The following bits in object **6041_h** (statusword) have a special function:

Bit	Value	Description
8	0	The controller is not in sync with the fieldbus
8	1	The controller is in sync with the fieldbus
10	0	Reserved
10	1	Reserved
12	0	Controller does not follow the target; the preset of 60FE_h (Target Velocity) is ignored
12	1	Controller follows the target; object 60FE_h (Target Velocity) is used as the input for position control.
13	0	Reserved
13	1	Reserved

6.8.2 Object entries

The following objects are necessary for controlling this mode:

- **60FE_h** (Target Velocity): This object must be written cyclically with the speed set value.

- **6085_h** (Quick-Stop Deceleration): This object contains the braking deceleration for the case that a quick-stop is triggered (see "[CiA 402 Power State Machine](#)").
- **605A_h** (Quick-Stop Option Code): This object contains the option that is to be executed in the event of a quick-stop (see "[CiA 402 Power State Machine](#)").
- **6080_h** (Max Motor Speed): Maximum speed
- **60C2_h:01_h** (Interpolation Time Period): This object specifies the time of a *cycle*; a new set value must be written in **60FF_h** in these time intervals.
The following applies here: cycle time = value of **60C2_h:01_h** * 10^{value of **60C2:02**} seconds.
- **60C2_h:02_h** (Interpolation Time Index): This object specifies the time basis of the cycles. Currently, only value **60C2_h:02_h**=-3 is supported; this yields a time basis of 1 millisecond.
- **60B1_h** (Velocity Offset): Offset for the speed set value in [user-defined units](#)
- **60B2_h** (Torque Offset): Offset for the torque set value in tenths of a percent

The following objects can be read in this mode:

- **606C_h** (Velocity Actual Value)
- **607E_h** (Polarity)

6.9 Cyclic Synchronous Torque

6.9.1 Overview

6.9.1.1 Description

In this mode, the controller passes an absolute torque preset via the fieldbus at fixed time intervals (referred to in the following as a *cycle*). The controller then no longer calculates any ramps, but rather only follows the presets.

NOTE

This mode only functions if [closed loop](#) is activated, see also [Commissioning closed loop](#).

6.9.1.2 Activation

To activate the mode, the value "10" must be set in object **6060_h** (Modes Of Operation) (see "[CiA 402 Power State Machine](#)").

6.9.1.3 Controlword

In this mode, the bits of controlword **6040_h** have no special function.

6.9.1.4 Statusword

The following bits in object **6041_h** (statusword) have a special function:

Bit	Value	Description
8	0	The controller is not in sync with the fieldbus
8	1	The controller is in sync with the fieldbus
10	0	Reserved
10	1	Reserved
12	0	Controller does not follow the target; the preset of 6071_h (Target Torque) is ignored
12	1	Controller follows the target; object 6071_h (Target Torque) is used as the input for position control.
13	0	Reserved
13	1	Reserved

6.9.2 Object entries

The following objects are necessary for controlling this mode:

- 6071_h (Target Torque): This object must be written cyclically with the torque set value and is to be set relative to 6072_h .
- 6072_h (Max Torque): Describes the maximum permissible torque.
- 6073_h (Max Current):
Maximum current. The minimum of 6073_h and 6072_h is used as limit for the torque in 6071_h .
- 6080_h (Max Motor Speed): Maximum speed
- $60C2_h:01_h$ (Interpolation Time Period): This object specifies the time of a *cycle*; a new set value must be written in 6071_h in these time intervals.
The following applies here: cycle time = value of $60C2_h:01_h * 10^{\text{value of } 60C2:02}$ seconds.
- $60C2_h:02_h$ (Interpolation Time Index): This object specifies the time basis of the cycles. Currently, only value $60C2_h:02_h = -3$ is supported; this yields a time basis of 1 millisecond.
- $60B2_h$ (Torque Offset): Offset for the torque set value in tenths of a percent

The following objects can be read in this mode:

- $606C_h$ (Velocity Actual Value)
- 6074_h (Torque Demand)

6.10 Clock-direction mode

6.10.1 Description

In clock-direction mode, the motor is operated via two inputs by a higher-level positioning controller with clock and direction signal. On each clock signal, the motor moves one step in the direction corresponding to the direction signal.

6.10.2 Activation

To activate the mode, the value "-1" (or "FFh") must be set in object 6060_h (Modes Of Operation) (see "[CiA 402 Power State Machine](#)").

6.10.3 General

The following data apply for every subtype of the clock-direction mode:

- The maximum frequency of the input pulse is 1 MHz; the ON pulse should not be less than 200 ns.

- The demand position resulting from the input pulses is updated cyclically; the cycle time corresponds to the Interpolation Time Period ($60C2_h$). The input pulses that arrive within a cycle are collected and buffered in the controller.
- The steps are scaled using objects 2057_h and 2058_h . The following formula applies here:

$$\text{step width per pulse} = \frac{2057_{\text{h}}}{2058_{\text{h}}}$$

The "step size per pulse" value is set to 128 ($2057_{\text{h}}=128$ and $2058_{\text{h}}=1$) ex works, which corresponds to a quarter step per pulse. A full step is the value "512", a half step per pulse corresponds to "256", etc.

NOTE

For a stepper motor with 50 pole pairs, 200 full steps correspond to one mechanical revolution of the motor shaft.

In *clock-direction mode*, the BLDC motors are also handled as stepper motors by the controller. This means that for a BLDC motor with, e.g., 3 pole pairs, 12 (=4*3) full steps correspond to one revolution.

NOTE

If there is a change of direction, a time of at least 35 μs must elapse before the new clock signal is applied.

6.10.4 Statusword

The following bits in object 6041_{h} (statusword) have a special function:

- Bit 13 (Following Error): This bit is set in *closed loop* mode if the following error is greater than the set limits (6065_{h} (Following Error Window) and 6066_{h} (Following Error Time Out)).

6.10.5 Subtypes of the clock-direction mode

6.10.5.1 Clock-direction mode (TR mode)

To activate the mode, object $205B_{\text{h}}$ must be set to the value "0" (factory settings).

In this mode, the pulses must be preset via the clock input; the signal of the direction input specifies the direction of rotation here (see following graphic).

6.10.5.2 Right / left rotation mode (CW / CCW mode)

To activate the mode, object $205B_{\text{h}}$ must be set to the value "1".

In this mode, the input that is used decides the direction of rotation (see following graphic).

6.11 Auto setup

6.11.1 Description

To determine a number of parameters related to the motor and the connected sensors (encoders/Hall sensors), an *auto setup* is performed. Closed Loop operation requires a successfully completed *auto setup*. *Auto setup* is only to be performed once during commissioning as long as the motor/sensor connected to the controller is not changed. For details, see [the corresponding section in chapter Commissioning](#).

6.11.2 Activation

To activate the mode, the value "-2" ("FE_h") must be set in object 6060_h (Modes Of Operation) (see [CiA 402 Power State Machine](#)).

6.11.3 Controlword

The following bits in object 6040_h (controlword) have a special function:

- Bit 4 starts a travel command. This is carried out on a transition from "0" to "1".

6.11.4 Statusword

The following bits in object 6041_h (statusword) have a special function:

- Bit 10: Indexed: indicates whether (= "1") or not (= "0") an encoder index was found.
- Bit 12: Aligned: this bit is set to "1" after *auto setup* has concluded

7 Special functions

7.1 Digital inputs and outputs

This controller is equipped with digital inputs and outputs.

7.1.1 Bit assignment

The software of the controller assigns each input and output two bits in the respective object (e.g., 60FD_h Digital Inputs or 60FE_h Digital Outputs):

1. The first bit corresponds to the special function of an output or input. These functions are always available on bits 0 to 15 (inclusive) of the respective object. These include the limit switches and the home switch for the digital inputs and the brake control for the outputs.
2. The second bit shows the output/input as a level; these are then available on bits 16 to 31.

Example

To manipulate the value of output 2, always use bit 17 in 60FE_h.

To activate the "negative limit switch" special function of input 1, set bit 0 in 3240_h:01_h; to query the status of the input, read bit 0 in 60FD_h. Bit 16 in 60FD_h also shows the status of input 1 (independent of whether or not the special function of the input was activated).

This assignment is graphically illustrated in the following drawing.

Bits of any object for controlling inputs

7.1.2 Digital inputs

7.1.2.1 Overview

NOTE

For digital inputs with 5 V, the length of the supply lines must not exceed 3 meters.

NOTE

The digital inputs are sampled once per millisecond. Signal changes at the input less than one millisecond in duration are not processed.

The following inputs are available:

Input	Special function	Switching threshold switchable	Differential / single-ended
1	Negative limit switch	no	single-ended
2	Positive limit switch	no	single-ended
3	Home switch / direction input in clock-direction mode	no	single-ended
4	Clock input in clock-direction mode	no	single-ended

7.1.2.2 Object entries

The value of an input can be manipulated using the following OD settings, whereby only the corresponding bit acts on the input here.

- **3240_h:01_h** (Special Function Enable): This bit allows special functions of an input to be switched off (value "0") or on (value "1"). If input 1 is not used as, e. g., a negative limit switch, the special function must be switched off to prevent an erroneous response to the signal generator. The object has no effect on bits 16 to 31.

The firmware evaluates the following bits:

- Bit 0: Negative limit switch (see [Limitation of the range of motion](#))
- Bit 1: Positive limit switch (see [Limitation of the range of motion](#))
- Bit 2: Home switch (see [Homing](#))
- Bit 3: Interlock (see [interlock function](#))

If, for example, two limit switches and one home switch are used, bits 0–2 in **3240_h:01_h** must be set to "1".

- **3240_h:02_h** (Function Inverted): This subindex switches from normally open logic (a logical high level at the input yields the value "1" in object **60FD_h**) to normally closed logic (the logical high level at the input yields the value "0").
This applies for the special functions (except for the clock and direction inputs) and for the normal inputs. If the bit has the value "0", normally open logic applies; for the value "1", normally closed logic applies. Bit 0 changes the logic of input 1, bit 1 changes the logic of input 2, etc.
- **3240_h:03_h** (Force Enable): This subindex switches on the software simulation of input values if the corresponding bit is set to "1".
In this case, the actual values are no longer used in object **3240_h:04_h**, but rather the set values for the respective input. Bit 0 corresponds to input 1 here, bit 1 to input 2, etc.
- **3240_h:04_h** (Force Value): This bit specifies the value that is to be read as the input value if the same bit was set in object **3240_h:03_h**.
- **3240_h:05_h** (Raw Value): This object contains the unmodified input value.
- **60FD_h** (Digital Inputs): This object contains a summary of the inputs and the special functions.

7.1.2.3 Computation of the inputs

Computation of the input signal using the example of input 1:

The value at bit 0 of object **60FD_h** is interpreted by the firmware as negative limit switch; the result of the complete computation is stored in bit 16.

7.1.2.4 Input Routing

Principle

To perform the assignment of the inputs more flexibly, there is a mode called *Input Routing Mode*. This assigns a signal of a source to a bit in object $60FD_h$.

Activation

This mode is activated by setting object $3240_h:08_h$ (Routing Enable) to "1".

NOTE

Entries $3240_h:01_h$ to $3240_h:04_h$ then have **no** function until Input Routing is again switched off.

NOTE

If *Input Routing* is switched on, the initial values of 3242_h are changed and correspond to the function of the input as it was before activation of *Input Routing*. The inputs of the controller behave the same with activation of *Input Routing*. Therefore, you should not switch back and forth between the normal mode and *Input Routing*.

Routing

Object 3242_h determines which signal source is routed to which bit of $60FD_h$. Subindex 01_h of 3242_h determines bit 0, subindex 02_h determines bit 1, and so forth. The signal sources and their numbers can be found in the following lists.

Number		Signal source
dec	hex	
00	00	Signal is always 0
01	01	Physical input 1
02	02	Physical input 2
03	03	Physical input 3
04	04	Physical input 4
05	05	Physical input 5
06	06	Physical input 6
07	07	Physical input 7
08	08	Physical input 8
09	09	Physical input 9
10	0A	Physical input 10
11	0B	Physical input 11
12	0C	Physical input 12
13	0D	Physical input 13
14	0E	Physical input 14
15	0F	Physical input 15
16	10	Physical input 16
65	41	Hall input "U"
66	42	Hall input "V"
67	43	Hall input "W"
68	44	Encoder input "A"
69	45	Encoder input "B"
70	46	Encoder input "Index"
71	47	USB Power Signal

The following table describes the inverted signals of the previous table.

Number		Signal source
dec	hex	
128	80	Signal is always 1
129	81	Inverted physical input 1
130	82	Inverted physical input 2
131	83	Inverted physical input 3
132	84	Inverted physical input 4
133	85	Inverted physical input 5
134	86	Inverted physical input 6
135	87	Inverted physical input 7
136	88	Inverted physical input 8
137	89	Inverted physical input 9
138	8A	Inverted physical input 10
139	8B	Inverted physical input 11
140	8C	Inverted physical input 12
141	8D	Inverted physical input 13
142	8E	Inverted physical input 14

Number		Signal source
dec	hex	
143	8F	Inverted physical input 15
144	90	Inverted physical input 16
193	C1	Inverted Hall input "U"
194	C2	Inverted Hall input "V"
195	C3	Inverted Hall input "W"
196	C4	Inverted encoder input "A"
197	C5	Inverted encoder input "B"
198	C6	Inverted encoder input "Index"
199	C7	Inverted USB power signal

Example

Input 1 is to be routed to bit 16 of object $60FD_h$:

The number of the signal source for input 1 is "1". The routing for bit 16 is written in $3242_h:11_h$.

Hence, object $3242_h:11_h$ must be set to the value "1".

7.1.2.5 Interlock function

The interlock function is a release that you control via bit 3 in $60FD_h$. If this bit is set to "1", the motor can move. If the bit is set to "0", the controller switches to the error state and the action stored in $605E_h$ is executed.

To activate the interlock function, you must switch on the special function by setting bit 3 in $3240:01_h$ to "1".

Use *Input Routing* to define which signal source is routed to bit 3 of $60FD_h$ and is to control the interlock function.

Example

Input 4 is to be routed to bit 3 of object $60FD_h$ to control the interlock function. A low level is to result in an error state.

1. To activate *Input Routing*, set $3240_h:08_h$ to "1".
2. To route input 4 to bit 3, set $3242_h:04_h$ to "4".

7.1.3 Digital outputs

7.1.3.1 Outputs

The outputs are controlled via object $60FE_h$. Here, output 1 corresponds to bit 16 in object $60FE_h$, output 2 corresponds to bit 17, etc., as with the inputs. The outputs with special functions are again entered in the firmware in the lower bits 0 to 15. The only bit assigned at the present time is bit 0, which controls the motor brake.

7.1.3.2 Wiring

NOTE

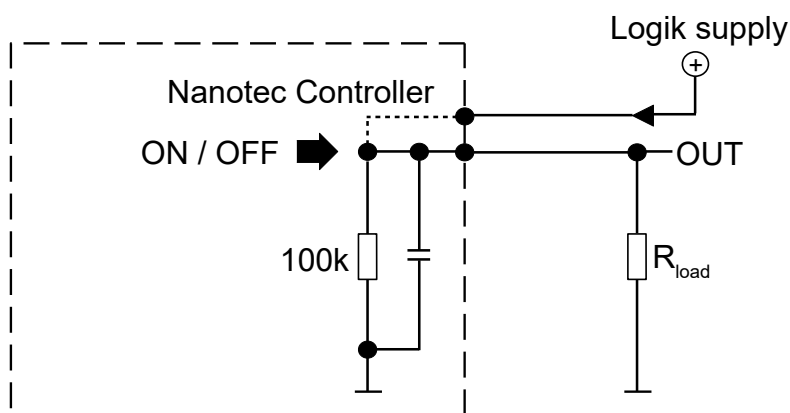

Always observe the maximum capacity of the output (see [Pin assignment](#)).

The digital outputs are positive switching (*high-side switch*).

NOTE

To use the digital outputs, you must connect a voltage (12...30 V DC) to pin 2 of X6 (logic supply). The output voltage corresponds to this voltage. The current should not exceed 100 mA.

7.1.3.3 Object entries

Additional OD entries are available for manipulating the value of the outputs (see the following example for further information). As with the inputs, only the bit at the corresponding location acts on the respective output:

- $3250_h:01_h$: No function.
- $3250_h:02_h$: This is used to switch the logic from *normally open* to *normally closed*. Configured as *normally open*, the output outputs a logical high level if the bit is "1". With the *normally closed* configuration, a logical low level is output accordingly for a "1" in object $60FE_h$.
- $3250_h:03_h$: If a bit is set here, the output is controlled manually. The value for the output is then in object $3250_h:4_h$; this is also possible for the brake output.
- $3250_h:04_h$: The bits in this object specify the output value that is to be applied at the output if manual control of the output is activated by means of object $3250_h:03_h$.
- $3250_h:05_h$: The bit combination applied to the outputs is stored in this subindex.
- $3250_h:08_h$: For activating the [Output Routing](#).
- $3250_h:09_h$: For switching control of the [Power LED](#) on/off. If bit 0 is set to "1", the green LED is activated (flashes in normal operation). If bit 1 is set to "1", the red LED is activated (flashes in case of an error). If the bit is set to "0", the respective LED remains off.

7.1.3.4 Computation of the outputs

Example for calculating the bits of the outputs:

7.1.3.5 Output Routing

Principle

The "Output Routing Mode" assigns an output a signal source; a control bit in object **60FE_h:01_h** switches the signal on or off.

The source is selected with **3252_h:01** to **n** in the "high byte" (bit 15 to bit 8). The assignment of a control bit from object **60FE_h:01_h** is performed in the "low byte" (bit 7 to bit 0) of **3252_h:01_h** to **n** (see following figure).

Activation

This mode is activated by setting object $3250_h:08_h$ (Routing Enable) to "1".

NOTE

Entries $3250_h:01_h$ to $3250_h:04_h$ then have **no** function until *Output Routing* is again switched off.

Routing

The subindex of object 3252_h determines which signal source is routed to which output. The output assignments are listed in the following:

Subindex 3252_h	Output Pin
01 _h	Configuration of the PWM output (software PWM)
02 _h	Configuration of output 1
03 _h	Configuration of output 2 (if available)
...	...
0n _h	Configuration of output n (if available)

NOTE

The maximum output frequency of the PWM output (software PWM) is 2 kHz. All other outputs can only produce signals up to 500 Hz.

Subindices $3252_h:01_h$ to $0n_h$ are 16 bits wide, whereby the high byte selects the signal source (e. g., the PWM generator) and the low byte determines the control bit in object $60FE_h:01$.

Bit 7 of $3252_h:01_h$ to $0n_h$ inverts the controller from object $60FE_h:01$. Normally, value "1" in object $60FE_h:01_h$ switches on the signal; if bit 7 is set, the value "0" switches on the signal.

TIP

To deactivate routing, enter the value $FFFF_h$.

Number in 3252:01 to 0n

00XX _h	Output is always "1"
01XX _h	Output is always "0"
02XX _h	Encoder signal (6063_h) with frequency divider 1
03XX _h	Encoder signal (6063_h) with frequency divider 2
04XX _h	Encoder signal (6063_h) with frequency divider 4
05XX _h	Encoder signal (6063_h) with frequency divider 8
06XX _h	Encoder signal (6063_h) with frequency divider 16
07XX _h	Encoder signal (6063_h) with frequency divider 32
08XX _h	Encoder signal (6063_h) with frequency divider 64
09XX _h	Position Actual Value (6064_h) with frequency divider 1
0AXX _h	Position Actual Value (6064_h) with frequency divider 2
0BXX _h	Position Actual Value (6064_h) with frequency divider 4
0CXX _h	Position Actual Value (6064_h) with frequency divider 8
0DXX _h	Position Actual Value (6064_h) with frequency divider 16
0EXX _h	Position Actual Value (6064_h) with frequency divider 32
0FXX _h	Position Actual Value (6064_h) with frequency divider 64
10XX _h	PWM signal that is configured with object $2038_h:05_h$ and 06_h
11XX _h	Inverted PWM signal that is configured with object $2038_h:05_h$ and 06_h

NOTE

On any change of the "encoder signal" (6063_h) or the current position (6064_h in user-defined units) by an increment, a pulse is output at the digital input (for frequency divider 1). Take this into account when selecting the frequency divider and the unit, especially when using sensors with low resolution (such as Hall sensors).

Example

The encoder signal (6063_h) is to be applied to output 1 with a frequency divider 4. The output is to be controlled with bit 5 of object $60FE:01$.

- $3250_h:08_h = 1$ (activate routing)
- $3252_h:02_h = 0405_h$ ($04XX_h + 0005_h$)
- $04XX_h$: Encoder signal with frequency divider 4
- 0005_h : Selection of bit 5 of $60FE:01$

The output is switched on by setting bit 5 in object $60FE:01$.

Example

The brake PWM signal is to be applied to output 2. Because the automatic brake control uses bit 0 of $60FE:01_h$, this should be used as control bit.

- $3250_h:08_h = 1$ (activate routing)
- $3252_h:03_h = 1080_h (=10XX_h + 0080_h)$. Where:
 - $10XX_h$: Brake PWM signal
 - 0080_h : Selection of the inverted bit 0 of object $60FE:01$

7.2 Analog inputs

The controller has an analog input with 10-bit resolution. It is located on pin 5 of X4.

You can read out the analog value in a NanoJ program and use it as you like, e. g., to specify the target speed.

7.2.1 Object entries

To read out and, if necessary, manipulate the value of the analog input, use the following OD settings:

- 3220_h (Analog Inputs):
This object displays the instantaneous values of the analog inputs in *ADC digits*.
- 3320_h (Read Analogue Input):
This object displays the instantaneous values of the analog inputs in user-defined units.
- 3321_h (Analogue Input Offset):
This is the offset that is added to the read analog value (3220_h) before scaling (multiplier from object 3322_h and divisor from object 3323_h).
- 3322_h (Analogue Input Factor Numerator):
This is the value by which the read analog value ($3220_h + 3321_h$) is multiplied before it is written in object 3320_h .
- 3323_h (Analogue Input Factor Denominator):
This is the value by which the read analog value ($3220_h + 3321_h$) is divided before it is written in object 3320_h .

7.2.2 Scale analog value

You read the value in object 3320_h (Read Analogue Input): This object displays the instantaneous values of the analog inputs in user-defined units.

The user-defined units are made up of offset (3321_h) and scaling value ($3322_h / 3323_h$). If both are still set to the default values, the value in 3320_h is specified in the *ADC Digits* unit.

Example

Analog input 1 has a measuring range of 0 V...+10 V. There is a voltage of 0 V...+10 V on the analog input, which, at a resolution of 10 bits, corresponds to the value range 0...1023 *ADC digits*.

To display the analog value in the physical unit of millivolt, proceed as follows:

1. Write the value "10000" (corresponds to the entire measurement range in millivolt) in $3322_h:01_h$ (Analogue Input Factor Numerator).
2. Write the value "1023" (corresponds to the resolution in digits) in $3323_h:01_h$ (Analogue Input Factor Denominator).

At the maximum voltage of 10 V, now read out the value "10000" in object 3320_h (Read Analogue Input):

$$1023 \text{ digits} * 10000 \text{ mV} / 1023 = 10000 \text{ mV}$$

7.3 I²t Motor overload protection

7.3.1 Description

NOTE

For stepper motors, only the rated current is specified, not a maximum current. No liability is therefore assumed when using I²t with stepper motors.

The goal of I²t motor overload protection is to protect the motor from damage and, at the same time, operate it normally up to its thermal limit.

This function is only available if the controller is in the closed loop mode (bit 0 of object 3202_h must be set to "1").

7.3.2 Object entries

The following objects affect I²t motor overload protection:

- 2031_h: Max Motor Current – specifies the maximum permissible motor current in mA.
- 203B_h:1_h Motor Rated Current – specifies the rated current in mA.
- 6073_h Max Current – specifies the maximum current in tenths of a percent of the set rated current.
- 203B_h:2_h Maximum Duration Of Peak Current – specifies the maximum duration of the maximum current in ms.

The following objects indicate the current state of I²t:

- 203B_h:3_h Threshold – specifies the limit in A²ms that determines whether the maximum current or rated current is switched to.
- 203B_h:4_h CalcValue – specifies the calculated value in A²ms that is compared with the threshold for setting the current.
- 203B_h:5_h LimitedCurrent – shows the momentary current value in mA that was set by I²t.
- 203B_h:6_h Status:
 - Value = "0": I²t deactivated
 - Value = "1": I²t activated

7.3.3 Activation

Closed loop must be activated, (bit 0 of object 3202_h set to "1", see also chapter Closed Loop).

To activate the mode, you must appropriately specify the four object entries mentioned above (2031_h, 6073_h, 203B_h:1_h, 203B_h:2_h). This means that the maximum current must be greater than the rated current and a time value for the maximum duration of the maximum current must be entered. If these conditions are not met, the I²t functionality remains deactivated.

7.3.4 Function of I²t

From the specification of rated current, maximum current and maximum duration of the maximum current, an I²t_{Lim} is calculated.

The motor can run with maximum current until the calculated I²t_{Lim} is reached. The current is then immediately reduced to the rated current. The maximum current is limited by the maximum motor current (2031_h).

The relationships are illustrated again in the following diagrams.

In the first section, t_1 , the current value is higher than the rated current. At time t_{1_Lim} , $I^2_{t_Lim}$ is reached and the current is limited to the rated current. A current that corresponds to the maximum current then occurs for a period of time t_2 . Hence, the value for $I^2_{t_Lim}$ is reached more quickly than in time t_1 .

7.4 Saving objects

7.4.1 General

Many objects in the object dictionary can be saved and then automatically reloaded the next time the controller is switched on or reset. Furthermore, the saved values are also retained following a firmware update.

Only entire collections of objects (referred to in the following as *categories*) can be saved together; individual objects cannot be saved.

An object can be assigned one of the following *categories*:

- Communication: Parameters related to external interfaces, such as PDO configuration etc.
- Application: Parameters related to operating modes.
- Customer: Parameters that are written and read by the customer/user only and are ignored by the controller firmware.
- Drive: Parameters related to the motor and the sensors (BLDC/Stepper, *closed/open loop*...). Some are set and saved by auto setup.
- Tuning: Parameters related to motor and encoder that are set either by auto setup or that can be found in the data sheets, e.g., pole pairs and maximum current.
- CANopen: Parameters related to CANopen communication
- Modbus RTU: Parameters related to Modbus RTU communication

If an object is not assigned one of these *categories*, it cannot be saved, e.g., statusword and all objects whose value is dependent on the current state of the controller.

The objects in each *category* are listed below. In chapter [Description of the object dictionary](#), the corresponding *category* for each object is also specified.

7.4.2 Category: communication

- 1005_h: COB-ID Sync

- 1006_h: Communication Cycle Period
- 1007_h: Synchronous Window Length
- 100C_h: Guard Time
- 100D_h: Live Time Factor
- 1014_h: COB-ID EMCY
- 1016_h: Consumer Heartbeat Time
- 1017_h: Producer Heartbeat Time
- 1019_h: Synchronous Counter Overflow Value
- 1029_h: Error Behavior
- 1400_h: Receive PDO 1 Communication Parameter
- 1401_h: Receive PDO 2 Communication Parameter
- 1402_h: Receive PDO 3 Communication Parameter
- 1403_h: Receive PDO 4 Communication Parameter
- 1404_h: Receive PDO 5 Communication Parameter
- 1405_h: Receive PDO 6 Communication Parameter
- 1406_h: Receive PDO 7 Communication Parameter
- 1407_h: Receive PDO 8 Communication Parameter
- 1600_h: Receive PDO 1 Mapping Parameter
- 1601_h: Receive PDO 2 Mapping Parameter
- 1602_h: Receive PDO 3 Mapping Parameter
- 1603_h: Receive PDO 4 Mapping Parameter
- 1604_h: Receive PDO 5 Mapping Parameter
- 1605_h: Receive PDO 6 Mapping Parameter
- 1606_h: Receive PDO 7 Mapping Parameter
- 1607_h: Receive PDO 8 Mapping Parameter
- 1800_h: Transmit PDO 1 Communication Parameter
- 1801_h: Transmit PDO 2 Communication Parameter
- 1802_h: Transmit PDO 3 Communication Parameter
- 1803_h: Transmit PDO 4 Communication Parameter
- 1804_h: Transmit PDO 5 Communication Parameter
- 1805_h: Transmit PDO 6 Communication Parameter
- 1806_h: Transmit PDO 7 Communication Parameter
- 1807_h: Transmit PDO 8 Communication Parameter
- 1A00_h: Transmit PDO 1 Mapping Parameter
- 1A01_h: Transmit PDO 2 Mapping Parameter
- 1A02_h: Transmit PDO 3 Mapping Parameter
- 1A03_h: Transmit PDO 4 Mapping Parameter
- 1A04_h: Transmit PDO 5 Mapping Parameter
- 1A05_h: Transmit PDO 6 Mapping Parameter
- 1A06_h: Transmit PDO 7 Mapping Parameter
- 1A07_h: Transmit PDO 8 Mapping Parameter
- 1F80_h: NMT Startup
- 2102_h: Fieldbus Module Control
- 3502_h: MODBUS Rx PDO Mapping
- 3602_h: MODBUS Tx PDO Mapping

7.4.3 Category: application

- 2034_h: Upper Voltage Warning Level
- 2035_h: Lower Voltage Warning Level
- 2036_h: Open Loop Current Reduction Idle Time
- 2037_h: Open Loop Current Reduction Value/factor
- 2038_h: Brake Controller Timing

- 203A_h: Homing On Block Configuration
- 203D_h: Torque Window
- 203E_h: Torque Window Time Out
- 203F_h: Max Slippage Time Out
- 2057_h: Clock Direction Multiplier
- 2058_h: Clock Direction Divider
- 205B_h: Clock Direction Or Clockwise/Counter Clockwise Mode
- 2084_h: Bootup Delay
- 2290_h: PDI Control
- 2300_h: NanoJ Control
- 2410_h: NanoJ Init Parameters
- 2800_h: Bootloader And Reboot Settings
- 3210_h: Motor Drive Parameter Set
- 3212_h: Motor Drive Flags
- 3240_h: Digital Inputs Control
- 3242_h: Digital Input Routing
- 3243_h: Digital Input Homing Capture
- 3250_h: Digital Outputs Control
- 3252_h: Digital Output Routing
- 3321_h: Analogue Input Offset
- 3322_h: Analogue Input Factor Numerator
- 3323_h: Analogue Input Factor Denominator
- 3700_h: Deviation Error Option Code
- 3701_h: Limit Switch Error Option Code
- 4013_h: HW Configuration
- 6040_h: Controlword
- 6042_h: VI Target Velocity
- 6046_h: VI Velocity Min Max Amount
- 6048_h: VI Velocity Acceleration
- 6049_h: VI Velocity Deceleration
- 604A_h: VI Velocity Quick Stop
- 604C_h: VI Dimension Factor
- 605A_h: Quick Stop Option Code
- 605B_h: Shutdown Option Code
- 605C_h: Disable Option Code
- 605D_h: Halt Option Code
- 605E_h: Fault Option Code
- 6060_h: Modes Of Operation
- 6065_h: Following Error Window
- 6066_h: Following Error Time Out
- 6067_h: Position Window
- 6068_h: Position Window Time
- 606D_h: Velocity Window
- 606E_h: Velocity Window Time
- 606F_h: Velocity Threshold
- 6070_h: Velocity Threshold Time
- 6071_h: Target Torque
- 6072_h: Max Torque
- 607A_h: Target Position
- 607B_h: Position Range Limit
- 607C_h: Home Offset
- 607D_h: Software Position Limit
- 607E_h: Polarity

- 607F_h: Max Profile Velocity
- 6081_h: Profile Velocity
- 6082_h: End Velocity
- 6083_h: Profile Acceleration
- 6084_h: Profile Deceleration
- 6085_h: Quick Stop Deceleration
- 6086_h: Motion Profile Type
- 6087_h: Torque Slope
- 6091_h: Gear Ratio
- 6092_h: Feed Constant
- 6096_h: Velocity Factor
- 6097_h: Acceleration Factor
- 6098_h: Homing Method
- 6099_h: Homing Speed
- 609A_h: Homing Acceleration
- 60A2_h: Jerk Factor
- 60A4_h: Profile Jerk
- 60A8_h: SI Unit Position
- 60A9_h: SI Unit Velocity
- 60B0_h: Position Offset
- 60B1_h: Velocity Offset
- 60B2_h: Torque Offset
- 60C1_h: Interpolation Data Record
- 60C2_h: Interpolation Time Period
- 60C4_h: Interpolation Data Configuration
- 60C5_h: Max Acceleration
- 60C6_h: Max Deceleration
- 60E8_h: Additional Gear Ratio - Motor Shaft Revolutions
- 60E9_h: Additional Feed Constant - Feed
- 60ED_h: Additional Gear Ratio - Driving Shaft Revolutions
- 60EE_h: Additional Feed Constant - Driving Shaft Revolutions
- 60F2_h: Positioning Option Code
- 60F8_h: Max Slippage
- 60FE_h: Digital Outputs
- 60FF_h: Target Velocity

7.4.4 Category: drive

- 3202_h: Motor Drive Submode Select
- 320D_h: Torque Of Inertia Factor
- 320E_h: Closed Loop Controller Parameter
- 320F_h: Open Loop Controller Parameter
- 6073_h: Max Current
- 6080_h: Max Motor Speed

7.4.5 Category: tuning

- 2030_h: Pole Pair Count
- 2031_h: Max Motor Current
- 203B_h: I2t Parameters
- 3203_h: Feedback Selection
- 3380_h: Feedback Sensorless
- 3390_h: Feedback Hall
- 33A0_h: Feedback Incremental A/B/I 1

- 4021_h: Ballast Configuration
- 6075_h: Motor Rated Current
- 608E_h: Position Encoder Resolution
- 6090_h: Velocity Encoder Resolution
- 60E6_h: Additional Position Encoder Resolution - Encoder Increments
- 60EB_h: Additional Position Encoder Resolution - Motor Revolutions

7.4.6 Category: CANopen

- 2005_h: CANopen Baudrate
- 2007_h: CANopen Config
- 2009_h: CANopen NodeID

7.4.7 Category: Modbus RTU

- 2028_h: MODBUS Slave Address
- 202A_h: MODBUS RTU Baudrate
- 202D_h: MODBUS RTU Parity

7.4.8 Starting the save process

CAUTION

Uncontrolled motor movements!

Control may be affected while saving. Unforeseen reactions can result.

- ▶ The motor must be at a standstill before starting the saving process. The motor must not be started while saving.

NOTE

- Saving may take a few seconds. Under no circumstances may you interrupt the voltage supply while saving. The state of the saved objects is otherwise undefined.
- Always wait until the controller has signaled that the save process has been successfully completed with the value "1" in the corresponding subindex in object 1010_h.

There is a subindex in object 1010_h for each *category*. To save all objects of this *category*, the value "65766173_h" must be written in the subindex. ¹ The controller signals the end of the save process by overwriting the value with a "1".

The following table shows which subindex of object 1010_h is responsible for which *category*.

Subindex	Category
01 _h	All categories with the exception of , 0A _h (CANopen) and 0B _h (Modbus RTU)
02 _h	Communication
03 _h	Application
04 _h	User
05 _h	Movement
06 _h	Tuning
0A _h	CANopen

¹ This corresponds to the decimal of 1702257011_d or the ASCII string `save`.

Subindex	Category
0B _h	Modbus RTU

7.4.9 Discarding the saved data

If all objects or one *category* of saved objects is to be deleted, value "64616F6C_h" must be written in object 1011_h.² The following subindices correspond to a *category* here:

Subindex	Category
01 _h	All categories (reset to factory settings) with the exception of 06 _h (Tuning) , 0A _h (CANopen) and 0B _h (Modbus RTU)
02 _h	Communication
03 _h	Application
04 _h	User
05 _h	Movement
06 _h	Tuning
0A _h	CANopen
0B _h	Modbus RTU

The saved objects are subsequently discarded; the change does not take effect until after the controller is restarted. You can restart the controller by entering the value "746F6F62_h" in 2800_h:01_h.

NOTE

- Objects of *category* 06_h (Tuning) are determined by *Auto setup* and are not reset when resetting to factory settings with subindex 01_h (thereby making it unnecessary to again perform an auto setup). You can reset these objects with subindex 06_h.
- Objects of *categories* 0A_h (CANopen) and 0B_h (Modbus RTU) are not reset with subindex 01_h.

7.4.10 Verifying the configuration

Object 1020_h can be used to verify the configuration. It acts as a modification marker similar to common text editors: as soon as a file is modified in the editor, a marker (usually an asterisk) is added.

The entries of object 1020_h can be written with a date and time and then saved together with all other savable objects with 1010_h:01.

The entries of 1020_h are reset to "0" as soon as a savable object (including 1010_h:0x_h, except for 1010_h:01_h and 1020_h) is written.

The following sequence makes verification possible:

1. An external tool or master configures the controller.
2. The tool or master sets the value in object 1020_h.
3. The tool or master activates the saving of all objects 1010_h:01_h = 65766173_h. The date and time in object 1020_h are also saved.

After the controller is restarted, the master can check the value in 1020_h:01_h and 1020:01_h. If one of the values is "0", the object dictionary was changed after the saved values were loaded. If the date or time in 1020 does not correspond to the expected value, objects were probably saved with values other than those that were expected.

² This corresponds to the decimal of 1684107116_d or the ASCII string load.

8 CANopen

You can address the controller using CANopen. The controller can function in a network as a *slave*.

In this chapter, the services of the CANopen communication structure are described. The CANopen messages are individually broken down.

8.1 General

TIP

- Only 11-bit CAN-IDs are currently supported.
- With CANopen, the data are always sent over the bus in little-endian format.

8.1.1 CAN message

CAN messages are described in this chapter; these are written in the following format:

583 | 41 09 10 00 1E 00 00 00

183R | DLC=0

The individual messages are written as follows:

- All numbers are written in hexadecimal notation; due to the abbreviated notation, the leading $0x$ is omitted.
- Normal data message: The CAN-ID is prefixed to the CAN message; in the above example, the ID 583 (i.e., 583_h or 1411_d). The data and the CAN-ID are separated from the data with a pipe character.
- RTR message (remote transmission request): If an R follows the CAN-ID instead of the data, the length of the *DLC* (Download Content) is specified. In the above example, the length of the *DLC* is 0.

8.2 CANopen services

The CANopen stack offers the services listed in the following table; more detailed descriptions can be found in the respective chapters.

Default CAN-ID	Service	Description in
000 _h	Network Management (NMT)	Section Network Management (NMT)
080 _h	Synchronization Object	Section Synchronization object (SYNC)
080 _h +Node-ID	Emergency	Section Emergency Object (EMCY)
180 _h +Node-ID	TX Process Data Objects (PDO)	Section Process Data Object (PDO)
200 _h +Node-ID	RX Process Data Objects (PDO)	
280 _h +Node-ID	TX Process Data Objects (PDO)	
300 _h +Node-ID	RX Process Data Objects (PDO)	

Default CAN-ID	Service	Description in
380 _h +Node-ID	TX Process Data Objects (PDO)	
400 _h +Node-ID	RX Process Data Objects (PDO)	
480 _h +Node-ID	TX Process Data Objects (PDO)	
500 _h +Node-ID	RX Process Data Objects (PDO)	
580 _h +Node-ID	TX Service Data Objects (SDO)	Section Service Data Object (SDO)
600 _h +Node-ID	RX Service Data Objects (SDO)	
700 _h +Node-ID	BOOT-UP Protocol	Section Boot-Up Protocol
700 _h +Node-ID	Nodeguarding and Heartbeat	Section Heartbeat and Nodeguarding

8.2.1 Network Management (NMT)

The network management follows a master-slave structure. NMT requires a CANopen device in the network that performs the role of the CANopen master.

All other devices have the role of the NMT slave. Each NMT slave can be addressed via its individual node-ID in the range from [1–127]. NMT services can be used to initiate, start, monitor, reset or stop CANopen devices.

In doing so, the controller follows the state diagram shown in the following figure. The "Initialization" state is only reached after switching on or by sending a "Reset Communication" or "Reset Node" NMT command. The "Pre-Operational" state is automatically activated after initialization.

In object 1F80_h, you can set whether the "Operational" state is automatically switched to afterwards, thereby allowing you to avoid sending an additional NMT command.

Shown in the following table is an overview of the activity of the services in the respective states.

Note that the *Stopped* state stops communication completely and only permits controller of the NMT state machine.

Service	Initializing	Pre-Operational	Operational	Stopped
PDO			Active	
SDO		Active	Active	
SYNC		Active	Active	
EMCY		Active	Active	
BOOT-UP	Active			
NMT		Active	Active	Active

The "Network Management" message has CAN-ID 0. A message is always two bytes long and has the following structure:

Here, the <CMD> corresponds to one of the following bytes (see also the legend in the figure of the [NMT state diagram](#)):

<CMD>	Meaning
01 _h	Switch to the "Operational" state
02 _h	Switch to the "Stop" state
80 _h	Switch to the "Pre-Operational" state
81 _h	Reset Node
82 _h	Reset Communication

Completely restart the controller with the "Reset Node" command. Use the "Reset Communication" command to reset the CANopen settings and restart the communication.

The value for <Node-ID> can be 00_h; in this case, the NMT command applies for all devices on the CAN bus (broadcast). If a number not equal to zero is used, only the device with the corresponding node-ID is addressed.

Example: If all devices on the CAN bus are to be switched to the "Stop" operating state, a broadcast with the "Switch to the Stop state" command can be used. The NMT message is structured as follows:

000 | 02 00

If only the device with node-ID 42 is to be completely restarted, the following CAN message is to be sent:

000 | 01 2A

8.2.2 Synchronization object (SYNC)

The Synchronization object is used to simultaneously validate the time of PDO data for all devices on the bus. The sync message is structured as follows:

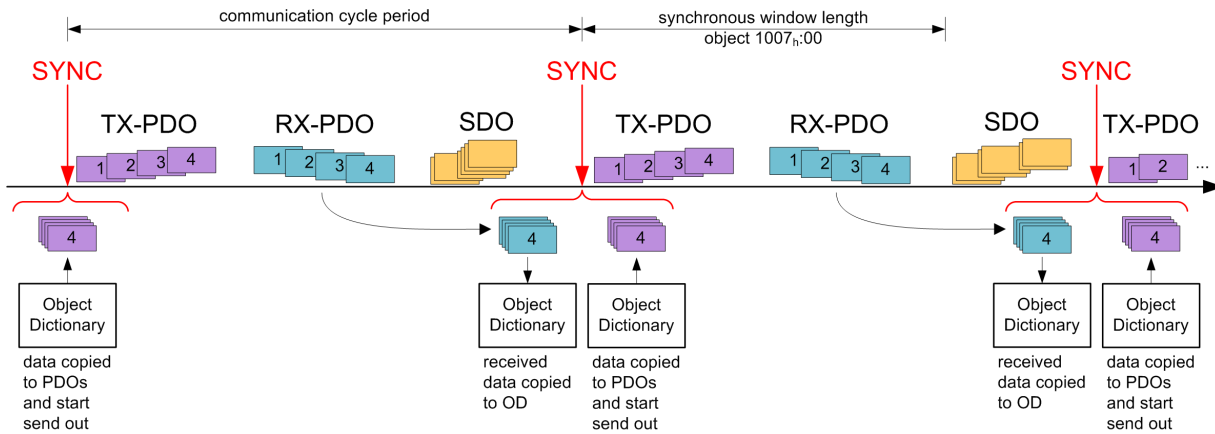

For SYNC operation, transmission mode (Transmission Type) 0 is usually used for the RX-PDOs (data are valid with the next SYNC); for TX-PDOs, a transmission mode between 1 and 240 is selected. (Details: see chapter [Process Data Object \(PDO\)](#)).

After receiving a SYNC message, there is a time window ("synchronous window") within which PDO messages can be sent and received. If the time of the window has elapsed, all devices must stop sending PDOs. The "synchronous window length" can be set in microseconds in object 1007_h:00_h.

A typical CAN-SYNC operation is divided into four phases (see also the following figure):

1. The SYNC message is received. The previously received RX-PDO data are thereby copied to the object dictionary (if present). At that time, the data are also sampled and copied to the TX-PDOs and the sending of these messages initiated.
2. The TX-PDOs are then sent by all slaves on the bus.
3. Afterwards, the PDOs are sent by the CANopen master. After the "synchronous window length" time has elapsed, no further PDOs are permitted.
4. SDO messages can be exchanged at the latest when the "synchronous window" is closed again.

If the *Sync Producer* supports a *Sync Counter*, the sync message receives an additional 1-byte numerical value. This counter is increased by the value "1" per sent sync message and is reset each time the value 1019h Synchronous Counter Overflow Value is reached.

For each *TX-PDO*, a start value of the *Sync Counter* can be defined in subindex 06_h of the corresponding communication parameter (e.g., in 1800_h;06_h) beginning with which the *slave* is to respond to the sync for the first time and send the PDO. The function is not activated until a value greater than 1 is set in 1019_h.

8.2.3 Emergency Object (EMCY)

A message of type "Emergency" is sent whenever an error occurs in the controller that was not caused by an SDO access. This service is unconfirmed and is sent with CAN-ID 80_h+Node-ID.

The emergency message is structured as follows:

A total of three error codes are transferred here:

- the "Emergency Error Code" (<EMCY Error Code>)
- the content of the "Error Register" object (1001_h), E-REG
- the "Error Number" (E-Number)

8.2.3.1 Error handling

A module for error handling processes all errors that occur internally. Each error is classified into an error class.

Each error that occurs is handled as follows:

1. The bit that belongs to the error in the "Error Register" object (1001_h) is set.

2. Three pieces of information are then written together in the "Pre-defined Error Field" object (1003_h:01):

- The *Emergency Error Code*
- The *Error Register*
- The manufacturer-specific error code

3. If no further errors are pending, the following message is sent:

80 + Node-ID | 00 00 E-REG E-Number 00 00 00 00

In object 1029_h, you can configure whether and how the controller is to change its *NMT state* in case of an error.

8.2.4 Service Data Object (SDO)

A "Service Data Object" permits read or write access of the object dictionary.

In the following, the owner of the object dictionary is referred to as the "server"; the CAN node – which wants to request or write the data – is referred to as the "client".

An "upload" refers to the reading of a value of an object from the object dictionary; a "download" refers to the writing of a value in the object dictionary. In addition, the following abbreviations are used in the diagrams:

- <IDX>: Index of the object that is to be read or written in the object dictionary; the LSB of the index is in byte 1 here. Example: The statusword of the controller has index 6041_h; byte 1 is then written with 41_h and byte 2 with 60_h. With Expedited Transfer, the SDO answer contains the same index as that of the request.
- <SUBIDX>: Subindex of the object in the object dictionary from 00_h to FF_h. With Expedited Transfer, the answer of the SDO message of the controller also contains the subindex of the request.

Because CAN messages of type SDO contain a large amount of metadata, you should only use SDO messages to configure the controller. Should it be necessary to cyclically exchange data during running operation, use CANOpen messages of type PDO (see subsection Process Data Object).

The SDO transfers are divided into three types of access:

- "expedited transfer" for transferring objects with up to four bytes.
- "normal transfer" for transferring any number of bytes, whereby each CAN message is confirmed individually.
- "block transfer" is also for any number of bytes; here, a given block of CAN tickets is confirmed at once.

An SDO message is sent to CAN-ID 600_h + node-ID, the answer comes from CAN-ID 580_h + node-ID.

8.2.4.1 Expedited Transfer

This method is used to write (download) or read (upload) values in objects of type (UN)SIGNED8, INTEGER16 oder INTEGER32 in the object dictionary. This service is confirmed, i.e., each access is answered with data, with a confirmation or with an error message.

SDO Download

An expedited SDO message for writing data in the object dictionary of the server is structured as follows:

Here, the <CMD> byte is dependent on the length of the data that are to be written. <CMD> can be one of the following values:

- 1 byte data length: 2F_h
- 2 byte data length: 2B_h
- 3 byte data length: 27_h
- 4 byte data length: 23_h

The <Data> field is written with the data that are to be written; the LSB of the data is entered in byte 4.

The answer from the server is either a confirmation of the write operation or an error message (structure of the messages: see following figure). In the latter case, the reason for the error is also sent with the data (see list of the SDO error messages in section [SDO error messages](#)).

Example: Set object 607A_h:00_h (target position, SIGNED32) to value 3E8_h (=1000_d) of a controller with node-ID 3:

603 | 23 7A 60 00 E8 03 00 00

Where

- Byte 1 (23_h): SDO expedited download, 4 bytes of data (SIGNED32)
- Bytes 2 and 3 (7A_h 60_h): index of object is 607A_h
- Byte 4 (00_h): subindex of object is 00_h
- Bytes 5 to 8 (E8_h 03_h 00_h 00_h): value of object: 000003E8_h

If successful, the controller responds with this message:

583 | 60 7A 60 00 00 00 00 00

SDO upload

A CAN message for reading an object from the object dictionary has the following structure:

The server responds with one of the following messages.

The length of the data is encrypted in the <CMD> of the answer:

1 byte data length:	4F _h
2 byte data length:	4B _h
3 byte data length:	47 _h
4 byte data length:	43 _h

The LSB of the data is again in byte 4 here.

In case of an error, the reason for the error is also specified in the data (see list of SDO error messages in [SDO error messages](#)).

Example: To read the "statusword" object (6041_h:00) from the object dictionary, it suffices to send the following message (always 8 bytes):

```
603 | 40 41 60 00 00 00 00 00
```

The controller generally responds with the following message:

```
583 | 4B 41 60 00 40 02 00 00
```

Where

- Byte 1 (4B_h): SDO expedited upload, 2 bytes of data (UNSIGNED16)
- Bytes 2 and 3 (41_h 60_h): index of object is 6041_h
- Byte 4 (00_h): subindex of object is 00_h

- Bytes 5 to 6 (40_h 02_h): value of object: 0240_h
- Bytes 7 to 8 (00_h 2h h h): empty. An SDO message always consists of 8 bytes.

8.2.4.2 Normal Transfer

Unlike "expedited" CANopen transfer, "normal transfer" is not limited to maximum four bytes. With this type of transfer, the content of multiple messages is grouped together with respect to content; such a block of messages is referred to in the following as a "transfer". Each message within a transfer is confirmed individually here.

NOTE

If your CANopen master does not support normal transfer, there is another way to access objects of data type String: each string can be read out character by character with an SDO upload to subindex 1 and the following subindices.

SDO upload

Shown in the following figure is the procedure for an "SDO upload" (client requests that the content of an object be sent to it). The transfer is broken down into two phases: an initialization phase and a transfer phase.

As with an "expedited transfer", the upload begins with the client sending an "Init SDO Update" to the server (see following figure).

The answer for a "normal transfer" does not contain the quantity of bytes to be received encoded in the <CMD>. It is instead entered in the data range as can be seen in the following figure in the <DATA LENGTH> area.

The initialization is thereby concluded; all that remains is the upload of the data. A data packet is requested with the following SDO request:

Byte 0 with command <CMD> is structured as follows:

The bit with designation ⊕ alternates with each request ("toggle bit"). It begins each transfer with 0, even if the previous transfer was aborted.

The controller responds to the above message with the data, whereby the message is structured as follows:

Client

Server

Byte 0 with <CMD> is structured as follows:

The bits have the following meaning here:

t (toggle bit)

The bit alternates with each message sequence; it does not change within a sequence between "request" and "response".

n (number of bytes)

These three bits specify how many bytes contain *no* data. Example: If bits 2 and 1 are set to 0 and bit 3 is set to 1, then $011_b = 03_d$ bytes are not valid. This, in turn, means that byte 1 to byte 4 contain allowed values and byte 5 to byte 7 should be disregarded.

c (more segments)

If no further SDO segments are sent and this is the last segment, the bit is set to 1.

Example: In this example, the "Manufacturer Software Version" object ($100A_h$) is to be read. The node-ID of the node in this example is 3.

The corresponding SDO message sequence is listed in the following table. The string that is to be read out varies from controller to controller.

COB-ID	Data	Description
603 _h	40 0A 10 00 00 00 00 00	Init Upload; Index: 100A _h ; Subindex: 00
583 _h	41 0A 10 00 11 00 00 00	Init Upload; Size: indicated; transfer type: normal; Num of bytes: 17; Index: 100A _h ; Subindex: 00
603 _h	60 0A 10 00 00 00 00 00	Upload Segment Req.; Toggle bit: not set
583 _h	00 46 49 52 2D 76 31 37	Upload Segment Conf.; More segments: yes; num of bytes: 7; Toggle bit: not set
603 _h	70 0A 10 00 00 00 00 00	Upload Segment Req.; Toggle bit: set
583 _h	10 34 38 2D 42 35 33 38	Upload Segment Conf.; More segments: yes; num of bytes: 7; Toggle bit: set
603 _h	60 0A 10 00 00 00 00 00	Upload Segment Req.; Toggle bit: not set
583 _h	09 36 36 32 00 00 00 00	Upload Segment Conf.; More segments: no (last segment); num of bytes: 3; Toggle bit: not set

46 49 52 2D 76 31 37 34 38 2D 42 35 33 38 36 36 32

This corresponds to string: "FIR-v1748-B538662"

Aborting the SDO transfer

Both the server and the client are authorized to abort the current transfer. To do this, an "Abort SDO Transfer" must be sent; this is depicted in the following.

After receiving the message, the SDO transfer is considered ended; the service is not confirmed.

A new SDO transfer must then be started from the very beginning. Transfer of the <ERROR CODE> is optional; the controller does not evaluate the code.

8.2.4.3 SDO error messages

In case of an error, an error number specifying the reason for the error is also sent in the data area.

Error Code	Description
05030000 _h	<i>toggle bit not changed</i> : Valid only with "normal transfer" or "block transfer". The bit, which is to alternate after each transfer, did not change its state.
05040001 _h	<i>command specifier unknown</i> : Byte 0 of the data block contains a command that is not allowed.
06010000 _h	<i>unsupported access</i> : If "complete access" was requested via CAN over EtherCAT (CoE) (is not supported.)
06010002 _h	<i>read only entry</i> : An attempt was made to write to a constant or read-only object.
06020000 _h	<i>object not existing</i> : An attempt was made to access a non-existing object (index incorrect).
06040041 _h	<i>object cannot be pdo mapped</i> : An attempt was made to map an object in the PDO for which that is not permissible.
06040042 _h	<i>mapped pdo exceed pdo</i> : If the desired object were to be attached to the PDO mapping, the 8 bytes of the PDO mapping would be exceeded.
06070012 _h	<i>parameter length too long</i> : An attempt was made to write to an object with too much data; for example, with <CMD>=23 _h (4 bytes) to an object of type Unsigned8, <CMD>=2F _h would be correct.
06070013 _h	<i>parameter length too short</i> : An attempt was made to write to an object with too little data; for example, with <CMD>=2F _h (1 byte) to an object of type Unsigned32, <CMD>=23 _h would be correct.
06090011 _h	<i>subindex not existing</i> : An attempt was made to access an invalid subindex of an object; the index, on the other hand, would exist.
06090031 _h	<i>value too great</i> : Some objects are subject to restrictions in the size of the value; in this case, an attempt was made to write an excessively large value to the object. For example, the "Pre-defined error field: Number of errors" object for 1003 _h :00 may only be set to the value "0"; all other numerical values result in this error.
06090032 _h	<i>value too small</i> : Some objects are subject to restrictions in the size of the value. In this case, an attempt was made to write a value that is too small to the object.
08000000 _h	<i>general error</i> : General error that does not fit in any other category.
08000022 _h	<i>data cannot be read or stored in this state</i> : The parameters of the PDOs may only be changed in the "Stopped" or "Pre-Operational" state. Write access of

Error Code	Description
	objects 1400 _h to 1407 _h , 1600 _h to 1607 _h , 1800 _h to 1807 _h and 1A00 _h to 1A07 _h is not permissible in the "Operational" state.

8.2.5 Process Data Object (PDO)

A message that only contains process data is referred to as a "Process Data Object" (PDO). The PDO is intended for data that need to be exchanged cyclically.

The idea behind a PDO message is to remove all additional information (index, subindex and data length) from a CAN message and to only fill the CAN message with data. The source and target information for the PDO are stored separately in the so-called PDO mapping.

PDOs can only be used if the NMT state machine is in the "Operational" state (see section [Network Management \(NMT\)](#)); the PDOs must be configured in the "Pre-Operational" NMT state.

The controller supports a total of 8 independent PDO mappings; each corresponding PDO message can have a maximum of eight bytes (=64 bit) of user data. It is thereby possible to, for example, transfer two UNSIGNED32 values or one UNSIGNED32 and one UNSIGNED08; the message does not need to use all eight data bytes.

The PDOs differ yet again in the configuration in the send and receive configuration. The receive configuration describes the processing for PDO messages that are sent, and the send configuration describes the PDO messages that are to be sent.

8.2.5.1 RX configuration

To configure an RX-PDO, you must take into account three object categories in the object dictionary:

- The objects that describe the functionality of the mapping.
- The objects that describe the content of the mapping.
- The objects that are to receive the received data.

Configuration of the functionality (communication parameter)

The configuration of the first mapping is stored in the subindices of object 1400_h. The second mapping is configured in 1401_h and so on. In the following, we refer to 140N_h. Here, the configuration affects the COB-ID of the PDO message and the transfer type.

Objects 140N_h have only three subindices:

- Subindex 0 (max. subindex): Total number of subindices
- Subindex 1 (COB-ID): The COB-ID is stored here. For PDO mappings 1–4 (1600_h–1603_h), the CAN-ID is fixed depending on the node-ID and only the valid bit (bit 31) can be set in the COB-ID. From 1604_h–1607_h, the CAN-ID can be set independently (with the restriction that it not be used by other services, see table at the start of chapter [CANopen services](#)) as can the valid bit. The change of a COB-ID does not take effect until *after* the controller or communication is restarted (see [Network Management \(NMT\)](#)).

Mapping	COB-ID
1600 _h	200 _h + Node-ID
1601 _h	300 _h + Node-ID
1602 _h	400 _h + Node-ID
1603 _h	500 _h + Node-ID
1604 _h	xxx _h + Node-ID
1605 _h	xxx _h + Node-ID
1606 _h	xxx _h + Node-ID
1607 _h	xxx _h + Node-ID

- Subindex 2 (transmission type): A number is stored in this subindex that defines the time at which the received data become valid. The number and the corresponding meaning can be found in the following table.

140N _h :02 _h	Meaning
00 _h -F0 _h	Synchronous: The data are buffered and not until the next SYNC message is received do they become valid and are they taken over into the object dictionary.
F1 _h -FD _h	Reserved
FE _h , FF _h	Asynchronous: The data become valid when the PDO message is received and are taken over into the object dictionary.

Content of a mapping

The configuration of the content of a mapping is structured as follows (see also the following figure as an example):

- All subindices of a configuration object belong together. Thus, 1600_h with all subindices describes the first mapping, 1601_h the second RX-PDO mapping, etc.
- Subindex 00_h specifies how many objects are in a mapping. It simultaneously specifies how many of the subindices are valid. If object 1600_h:00_h is set to "0", RX mapping is thereby completely switched off. In the example shown in the following figure, two objects are thus mapped; object 1600_h:03_h and 1600_h:04_h is, therefore, not active (shown in gray).
- Each subindex from 1600_h:01_h to 1600_h:0F_h describes one target of the mapping sequentially and without gaps. The index, subindex and bit length are thereby encoded. Example from the following figure: The first two bytes of the message are to be written in object 6040_h:00_h. In hexadecimal notation, the content of 1600_h:01_h then consists of <Index><Subindex><Bit length> or 60400010. The second mapping (1600_h:02_h) contains the entry 607A0020. Thus, it maps the following four bytes (=20_hBit) in object 607A_h:00_h

Dummy objects

You can configure RX-PDOs so that more than one node can respond. In this case, it may be desirable for only part of the data contained in the PDO to be evaluated in one of the devices. For data not used locally, you can include a dummy object of one of the supported data types in the mapping of the PDO:

Index	Data type
0002 _h	INTEGER8

Index	Data type
0003 _h	INTEGER16
0004 _h	INTEGER32
0005 _h	UNSIGNED08
0006 _h	UNSIGNED16
0007 _h	UNSIGNED32

8.2.5.2 TX configuration

To configure a TX-PDO, you must take into account three object categories in the object dictionary:

- The objects that describe the functionality of the mapping.
- The objects that describe the content of the mapping.
- The objects that are to receive the data that are to be sent.

Also note that the time at which the data are copied to the TX-PDO message and the time of sending do not need to be the same (dependent on mode).

Configuration of the functionality (communication parameter)

The configuration of the functionality of the first mapping is stored in the subindices of object 1800_h. The second mapping is configured in 1801_h and so on. In the following, we refer to 180N_h. Here, the configuration affects the COB-ID of the PDO message and the transfer type.

Objects 180N_h have the following subindices:

- Subindex 0 (max. subindex): Total number of subindices
- Subindex 1 (COB-ID): The COB-ID is stored here. For PDO mappings 1–4 (1A00_h–1A03_h), the CAN-ID is fixed depending on the node-ID and only the valid bit (bit 31) can be set in the COB-ID. From 1A04_h–1A07_h, the CAN-ID can be set independently (with the restriction that it not be used by other services, see table at the start of chapter [CANopen services](#)) as can the valid bit. A COB-ID change does not take effect until *after* the controller or communication is restarted (see [Network Management \(NMT\)](#)).

Mapping	COB-ID
1A00 _h	180 _h + Node-ID
1A01 _h	280 _h + Node-ID
1A02 _h	380 _h + Node-ID
1A03 _h	480 _h + Node-ID
1A04 _h	xxx _h + Node-ID
1A05 _h	xxx _h + Node-ID
1A06 _h	xxx _h + Node-ID
1A07 _h	xxx _h + Node-ID

- Subindex 2 (transmission type): A number is stored in this subindex that defines the time at which the data are to be copied into the PDO message and when this is to be sent. The number and the corresponding meaning can be found in the following table. Below, we refer to an *Event* that can trigger the copying and/or sending of the data. This *Event* consists of three events, which can be considered independently of one another:
 - The NMT state machine is switched to "operational".
 - The current data have changed with respect to the last PDO message.
 - The *Event Timer* has expired (see 180N_h:5).

If the *Event Timer* is used, it is handled independently of the changes; the *Event Timer* is not restarted until the current event timer expires, not because of another *Event*.

180N _h : 02 _h	Meaning
0	Synchronous (acyclic): The data are copied to the TX-PDO upon arrival of the SYNC but are not sent until the <i>Event</i> .
01 _h -F0 _h	Synchronous (cyclic): The data are copied upon arrival of the nth SYNC message and are sent immediately thereafter (n corresponds to the number 1 to 240, transmission type "1" sends the new data on each SYNC).
F1 _h -FB _h	Reserved
FC _h	RTR-Only (synchronous): The data are copied upon arrival of each SYNC message but are sent only upon request with an RTR message.
FD _h	RTR-Only (event-driven): The data are copied to the TX-PDO message upon receipt of an RTR message and sent immediately thereafter.
FE _h , FF _h	The data are copied upon arrival of the <i>Event</i> and sent immediately.

- Subindex 3 (inhibit time): This subindex contains a time lock in 100 μs steps (see following figure). This can be used to set a time that must elapse after the sending of a PDO before the PDO is sent another time. This time only applies for asynchronous PDOs. This is intended to prevent PDOs from being sent continuously if the mapped object constantly changes.
- Subindex 4 (compatibility entry): This subindex has no function and exists only for compatibility reasons.
- Subindex 5 (event timer): This time (in ms) can be used to trigger an *Event* which handles the copying of the data and the sending of the PDO.
- Subindex 6 (sync start value): Here, the start value of the *Sync Counter* is entered beginning with which the *slave* is to initially respond to the sync and send the PDO. Not globally activated until a value greater than 1 is set in 1019h Synchronous Counter Overflow Value.

Content of a mapping

The configuration of the content of a mapping is structured as follows (see the following figure as an example):

- All subindices of a configuration object belong together. Thus, 1A00_h with all subindices describes the first mapping, 1A01_h the second TX-PDO mapping, etc.
- Subindex 00 specifies how many objects are in a mapping. It simultaneously specifies how many of the subindices are valid. If object 1A00_h:00_h is set to "0", TX mapping is thereby completely switched off. In the following example, two objects are thereby mapped in entries 1A00_h:01_h – 1A00_h:02_h. The objects in entries 1A00_h:03_h – 1A00_h:04_h are, thus, not mapped (shown in gray).
- Each subindex from 1A00_h:01_h to 1A00_h:0F_h respectively describes sequentially and without gaps (dummy objects can be used for gaps) one source of the mapping. The index, subindex and bit length are thereby encoded. Example from the following figure: The first two bytes of the message are to be read from object 6041_h:00_h. In hexadecimal notation, the content of 1A00_h:01_h then consists of <Index><Subindex><Bit Length>, or 60410010. The second mapping (1A00_h:02_h) contains the entry 60640020. Thus, it maps the following four bytes (corresponds to 32 bits) from object 6064_h:00_h in the TX-PDO message.

8.2.5.3 Presetting

The following configuration is preset:

RX-PDO

- Mapping (CAN-ID: 200_h + Node-ID):
 - 6040_h:00_h (controlword)
 - 6060_h:00_h (mode of operation)
 - 3202_h:00_h (motor drive submode select)
- Mapping (CAN-ID: 300_h + Node-ID):
 - 607A_h:00_h (target position)
 - 6081_h:00_h (profile velocity)
- Mapping (CAN-ID: 400_h + Node-ID): object 6042_h:00_h (vl target velocity)
- Mapping (CAN-ID: 500_h + Node-ID): object 60FE_h:01_h (digital outputs)

TX-PDO

- Mapping (CAN-ID: 180_h + Node-ID):
 - 6041_h:00_h (statusword)
 - 6061_h:00_h (Modes Of Operation Display)
- Mapping (CAN-ID: 280_h + Node-ID): 6064_h:00_h (Position actual value)
- Mapping (CAN-ID: 380_h + Node-ID): 6044_h:00_h (vl velocity actual value)
- Mapping (CAN-ID: 480_h + Node-ID): object 60FD_h:00_h (digital inputs)

8.2.5.4 Changing PDO mapping

You change the PDO mapping in the "Pre-operational" NMT state as follows:

- Deactivate the PDO by setting the *Valid Bit* (bit 31) of subindex 01h of the corresponding communication parameter (e.g., 1400_h:01_h) to "1".
- Deactivate the mapping by setting subindex 00h of the corresponding mapping parameter (e.g., 1600_h:00_h) to "0".
- Change the mapping in the desired subindices (e.g., 1600_h:01_h).
- Activate the mapping by writing the number of objects that are to be mapped in subindex 00h of the corresponding mapping parameter (e.g., 1600_h:00_h).
- Activate the PDO by setting bit 31 of subindex 01h of the corresponding communication parameter (e.g., 1400_h:01_h) to "0".

6. Store the configuration by writing the value "65766173h" in 1010_h:03_h.

8.2.6 Boot-Up Protocol

If the CAN slave reaches the "Pre-Operational" NMT state (see following figure), the following message is sent to signal operational readiness.

This service is unconfirmed; there is no response.

NOTE

The boot loader sends its own boot-up message. This can be suppressed, see object 2007_h:00

8.2.7 Heartbeat and Nodeguarding

With the "Heartbeat" and "Nodeguarding" services (often also referred to as "Lifeguarding"), switched-off or hung devices on the CAN bus can be found. For this purpose, the NMT master cyclically requests a message with the current NMT state of the slave (Nodeguarding).

The alternative is that each slave sends a message unprompted and cyclically (Heartbeat). A combination of Nodeguarding and Heartbeat is not permissible. Furthermore, it is recommended that Heartbeat be given preference over Nodeguarding, as Nodeguarding results in a higher load on the CAN bus.

8.2.7.1 Nodeguarding

This service is based on the fact that the NMT master sends an RTR message with CAN-ID 700_h + node-ID to the respective slave.

The slave must then send a message as response; this message is structured as follows. Bit 7 alternates here on each transfer, thereby allowing one to determine if a message was lost. Entered in bits 6 to 0 is the current NMT status of the slave.

With Nodeguarding, there exist three time intervals (see also the following figure):

- *guard time*: The time between two RTR messages. This can be different for each CAN node and is stored in the slave in object `100Ch:00` (unit: milliseconds)
- *live time factor*: A multiplier for the *guard time*; this is stored in the CAN slave in object `100Dh:00` and can be different for each slave on the CAN bus.
- *possible live time*: The time produced by multiplying *guard time* and *live time factor*.

The following conditions are checked during Nodeguarding:

- The NMT master must send the RTR request within the "possible live time".
- The slave must send the response to the RTR request within the "possible live time".
- The slave must respond with its NMT state. In addition, the "toggle bit" must be set correctly.

8.2.7.2 Heartbeat

If Heartbeat is activated, the slave sends its NMT state to the CAN bus unprompted and cyclically. You activate this service by setting the *Producer Heartbeat Time* time in object `1017h:00h` to a value other than zero. The *Producer Heartbeat Time* is measured in milliseconds. The message sent by the slave has the form shown below:

The slave must send the Heartbeat message within the *Heartbeat Consumer Time*. This time is known only to the master and is not stored in the controller.

The slave can also monitor a *Heartbeat* from another *producer* (master or another slave). To do this, enter the *Consumer Heartbeat Time* and the node-ID of the *producer* in object 1016_h.

Errors that occur during this monitoring are reset if either the function is deactivated or the *Heartbeat* is again sent within the correct time.

8.3 LSS protocol

The services of the *LSS protocol (Layer Settings Services)* are used to assign the node-ID and/or the baud rate of the controller directly via the CANopen bus. This is especially useful with devices that have no means for the mechanical configuration (e.g., rotary switches) of the parameters.

8.3.1 General

The *LSS protocol* requires a CANopen device in the network that performs the role of the *LSS master*. All other devices have the role of the *LSS slave*.

Each *LSS slave* is equipped with a unique *LSS address* that consists of the four 32-bit entries of object 1018_h Identity Object.

An *LSS slave* may either be in *configuration mode* or in *wait mode*. The *LSS master* is responsible for switching between the two modes. Some *LSS services (Configuration, Inquiry)* are only available in *configuration mode*.

8.3.2 LSS message

All messages of the *LSS protocol* consist of 8 bytes (*DLC=8*), whereby byte 0 always contains the *Command Specifier (CS)* of the service.

Two CAN IDs are reserved for the *LSS protocol*:

- 7E5_h: For the messages from the *LSS master* to the *LSS slaves* (request)
- 7E4_h: For the messages from the *LSS slaves* to the *LSS master* (response)

8.3.3 LSS services

Four service categories are supported:

- Switch state services
- Configuration services

- Inquiry services
- Identification services

8.3.3.1 Switch state services

With these services, the *LSS master* can switch the *LSS slaves* to *configuration mode* or to *wait mode*.

The node-ID and baud rate can only be changed with the Configuration services and Inquiry services while in *configuration mode*.

Switch state global service

With this service, the *LSS master* switches all *LSS slaves* in the network to *configuration mode* or to *wait mode*.

Byte 0 : CS (Command Specifier)

Value = "04_h"

Byte 1: mode

Value = "00_h": Switches to *wait mode*

Value = "01_h": Switches to *configuration mode*

Bytes 2-7 :

reserved (=0_h)

Switch state selective service

With this service, the *LSS master* switches the *LSS slaves* with the (or parts of the) corresponding *LSS address* to *configuration mode*.

The *LSS master* sends four messages, which contain the *LSS address*:

1. The *LSS master* switches the *LSS slaves* with the corresponding *vendor ID* to *configuration mode*:

Byte 0 : CS (Command Specifier)

Value = "40_h"

Bytes 1-4: Vendor-ID

Vendor-ID: see 1018_h:01_h

Bytes 5-7:

reserved (=0_h)

2. The *LSS master* switches the *LSS slaves* with the corresponding *product code* to *configuration mode*:

Byte 0 : CS (Command Specifier)

Value = "41_h"

Bytes 1-4: Product Code

Product code: see 1018_h:02_h

Bytes 5-7:

reserved (=0_h)

3. The *LSS master* switches the *LSS slaves* with the corresponding *revision number* to *configuration mode*:

Byte 0 : CS (Command Specifier)

Value = "42_h"

Bytes 1-4: Revision Number

Revision number: see 1018_h:03_h

Bytes 5-7:

reserved (=0_h)

4. The *LSS master* switches the *LSS slaves* with the corresponding *serial number* to *configuration mode*:

Byte 0 : CS (Command Specifier)

Value = "43_h"

Bytes 1-4: mode

Serial number: see 1018_h:04_h

Bytes 5-7:reserved (=0_h)

The *LSS slave* with the corresponding *LSS address* was switched to *configuration mode* and sends a confirmation:

**Byte 0 : CS (Command Specifier)**Value = "44_h"**Bytes 1-7 :**reserved (=0_h)**8.3.3.2 Configuration services**

With these services, the *LSS master* can change and, if necessary, store the node-ID or baud rate of the *LSS slaves*.

**NOTE**

The *LSS slaves* must be in *configuration mode*. See chapter [Switch state services](#).

Configure node-ID service

The *LSS master* sends a message with the new node-ID to an *LSS slave*:

**Byte 0 : CS (Command Specifier)**Value = "11_h"**Byte 1: N-ID (Node-ID)**Valid node-ID between 01_h and 7F_h**Bytes 2-7 :**reserved (=0_h)

The *LSS slave* responds with a confirmation/error code:

**Byte 0 : CS (Command Specifier)**Value = "11_h"**Byte 1: Error Code**Value = "00_h": Not an errorValue = "01_h": Invalid node-ID**Bytes 2-7 :**reserved (=0_h)**Configure bit timing parameters service**The *LSS master* sends a message with the new baud rate to an *LSS slave*:**Byte 0 : CS (Command Specifier)**Value = "13_h"**Byte 1: Table Selector**Value = "00_h": The table for the baud rate from the *CiA 301* standard is used.**Byte 2: Table Index**

The value for the index is taken from the following table.

Bytes 3-7 :reserved (=0_h)The following values are supported for the *Table Index*:

Table Index	Baud rate in kBd
0	1000
2	500
3	250
4	125
6	50
7	20
8	10

The *LSS slave* responds with a confirmation/error code:

Byte 0 : CS (Command Specifier)

Value = "13_h"

Byte 1: Error Code

Value = "00_h": Not an error

Value = "01_h": Invalid *Table Index*/baud rate is not supported

Bytes 2-7 :

reserved (=0_h)

Activate bit timing parameters service

The *LSS master* uses this command to activate the set baud rate of all *LSS slaves* in the network simultaneously:

Byte 0 : CS (Command Specifier)

Value = "51_h"

Bytes 1-2: Switch Delay

Delay in ms. It is thereby ensured that all *LSS slaves* in the network have the same baud rate before messages may again be sent.

After receiving this messages from each *LSS slave*, the time that is stored here is allowed to elapse. Only then is the new baud rate accepted.

The same time is allowed to elapse a second time; only then may an *LSS slave* send messages again.

Bytes 3-7 :

reserved (=0_h)

Store configuration service

With this command, the *LSS master* saves the set node-ID and baud rate of an *LSS slave*. The *LSS master* must ensure that at that moment only one *LSS slave* in the network is in *configuration mode*.

**Byte 0 : CS (Command Specifier)**Value = "17_h"**Bytes 1-7 :**reserved (=0_h)

The LSS slave responds with a confirmation/error code:

**Byte 0 : CS (Command Specifier)**Value = "17_h"**Byte 1: Error Code**Value = "00_h": Not an errorValue = "02_h": Access of non-volatile memory failed**Bytes 2-7 :**reserved (=0_h)**8.3.3.3 Inquiry services**

With these services, the LSS master can query the LSS address or the node-ID of an LSS slave. The LSS master must ensure that only one LSS slave in the network is in *configuration mode*.

Inquire LSS address service

With this service, the LSS master queries the LSS address of a slave.

1. The LSS master queries the vendor ID:**Byte 0 : CS (Command Specifier)**Value = "5A_h"

Bytes 1-7 :reserved (=0_h)The *LSS slave* returns its *vendor ID*:**Byte 0 : CS (Command Specifier)**Value = "5A_h"**Bytes 1-4: Vendor-ID***Vendor-ID*: see 1018_h:01_h**Bytes 5-7:**reserved (=0_h)2. The *LSS master* queries the *product code*:**Byte 0 : CS (Command Specifier)**Value = "5B_h"**Bytes 1-7 :**reserved (=0_h)The *LSS slave* returns its *product code*:**Byte 0 : CS (Command Specifier)**Value = "5B_h"**Bytes 1-4: Product Code***Product code*: see 1018_h:02_h**Bytes 5-7:**reserved (=0_h)3. The *LSS master* queries the *revision number*.

Byte 0 : CS (Command Specifier)

Value = "5C_h"

The LSS slave returns its *revision number*.

Byte 0 : CS (Command Specifier)

Value = "5C_h"

Bytes 1-4: Revision Number

Revision number: see 1018_h:03_h

Bytes 5-7:

reserved (=0_h)

4. The LSS master queries the *serial number*.

Byte 0 : CS (Command Specifier)

Value = "5D_h"

Bytes 1-7 :

reserved (=0_h)

The LSS slave returns its *serial number*.

Byte 0 : CS (Command Specifier)

Value = "5D_h"

Bytes 1-4: Serial Number

Serial number. see $1018_h:04_h$

Bytes 5-7:

reserved ($=0_h$)

Inquire node-ID service

With this service, the *LSS master* queries the node-ID of a slave.

The *LSS master* queries the node-ID:

**Byte 0 : CS (Command Specifier)**

Value = " $5E_h$ "

Bytes 1-7 :

reserved ($=0_h$)

The *LSS slave* responds with its node-ID:

**Byte 0 : CS (Command Specifier)**

Value = " $5E_h$ "

Byte 1: Node-ID

Node-ID of the *LSS slave*

Bytes 2-7 :

reserved ($=0_h$)

8.3.3.4 Identification services

With these services, the *LSS master* can ask the *LSS slaves* to identify themselves based on their *LSS address*.

LSS identify remote slave service

With this service, the *LSS master* asks the *LSS slaves* to identify themselves with the (or parts of the) corresponding *LSS address* with the LSS identify slave service.

A range can be defined for the *revision number* and the *serial number*. All *LSS slaves* whose numbers are in the corresponding range must identify themselves. It is the task of the *LSS master* to restrict the range so that ultimately only one *LSS slave* responds.

1. The *LSS master* defines the *Vendor-ID* of the *LSS slaves* that are to identify themselves:

Byte 0 : CS (Command Specifier)

Value = "46_h"

Bytes 1-4: Vendor-ID

Vendor-ID: see 1018_h:01_h

Bytes 5-7:

reserved (=0_h)

2. The *LSS master* defines the *product code* of the *LSS slaves* that are to identify themselves.:

Byte 0 : CS (Command Specifier)

Value = "47_h"

Bytes 1-4: Product Code

Product code: see 1018_h:02_h

Bytes 5-7:

reserved (=0_h)

3. The *LSS master* defines the lowest and highest *revision number* of a range. All *LSS slaves* whose *revision number* is within this range are to identify themselves:

Byte 0 : CS (Command Specifier)

Value = "48_h"

Bytes 1-4: Revision Number low

Lowest *revision number* of the range: see 1018_h:03_h

Bytes 5-7:

reserved (=0_h)

**Byte 0 : CS (Command Specifier)**Value = "49_h"**Bytes 1-4: Revision Number high**Highest *revision number* of the range: see 1018_h:03_h**Bytes 5-7:**reserved (=0_h)

4. The *LSS master* defines the lowest and highest *serial number* of a range. All *LSS slaves* whose *serial number* is within this range are to identify themselves:

**Byte 0 : CS (Command Specifier)**Value = "4A_h"**Bytes 1-4: Serial Number low**Lowest *serial number* of the range: see 1018_h:04_h**Bytes 5-7:**reserved (=0_h)**Byte 0 : CS (Command Specifier)**Value = "4B_h"**Bytes 1-4: Serial Number high**Highest *serial number* of the range: see 1018_h:04_h**Bytes 5-7:**reserved (=0_h)

LSS identify slave service

The *LSS slave* whose *LSS address* was defined with the LSS identify remote slave service by the *LSS master* identifies itself:

Byte 0 : CS (Command Specifier)

Value = "4F_h"

Bytes 1-7 :

reserved (=0_h)

8.3.4 Example

The controller (*LSS slave*) is delivered with the following parameters:

- Node-ID = 7F_h (=127_d)
- Baud rate = 1000 kBd

The parameters are to be set as follows:

- Node-ID = 05_h (=5_d)
- Baud rate = 125 kBd

It is assumed that only one *LSS slave* is currently present in the network.

1. The *LSS master* switches the *LSS slave* to *configuration mode* (see Switch state global service):

```
7E5 | 04 01 00 00 00 00 00 00
```

2. The *LSS master* queries the node-ID of the *LSS slave* (see Inquire node-ID service):

```
7E5 | 5E 00 00 00 00 00 00 00
```

The *LSS slave* responds with its node-ID:

```
7E4 | 5E 7F 00 00 00 00 00 00
```

3. The *LSS master* sets the node-ID to "05_h" (see Configure node-ID service):

```
7E5 | 11 05 00 00 00 00 00 00
```

The *LSS slave* confirms (error code=00_h):

```
7E4 | 11 00 00 00 00 00 00 00
```

4. The *LSS master* sets the baud rate to 125 kBd (*Table Index*=4) (see Configure bit timing parameters service):

```
7E5 | 13 00 04 00 00 00 00 00
```

The *LSS slave* confirms (error code=00_h):

```
7E4 | 13 00 00 00 00 00 00 00
```

5. The *LSS master* sends the command to save the changes (see Store configuration service):

```
7E5 | 17 00 00 00 00 00 00 00
```

6. The *LSS master* switches the *LSS slave* to *wait mode* (see Switch state global service):

```
7E5 | 04 00 00 00 00 00 00 00
```

The *LSS slave* confirms (error code=00_h):

```
7E4 | 17 00 00 00 00 00 00 00
```

7. The new parameters are accepted after the controller is restarted.

The controller registers with node-ID 5 and baud rate 125 kBd:

```
705 | 00
```

9 Modbus RTU

Modbus references: www.modbus.org.

- MODBUS APPLICATION PROTOCOL SPECIFICATION V1.1b3, Date: 26.04.2014, Version: 1.1b3
- MODBUS over Serial Line Specification and Implementation Guide V1.02, Date: 20.12.2006, Version: 1.02

The controller can be controlled by means of Modbus RTU. The I/O data, with, e.g., the preconfigured drive values (see [Process data objects \(PDO\)](#)), can be handled with the standard Modbus function codes. To configure your own I/O data, however, function code 2Bh (CAN Encapsulation) must be supported by the master in order for the parameters to be read and written independent of the process image.

If the master does not support this function code, the I/O image can be configured and stored using *Plug & Drive Studio*. The master can then access the data using the standard Modbus function codes.

Otherwise, configuration via the configuration file is possible (see chapter [Configuration via USB](#)) or the use of *Plug & Drive interface* (see document *Function description Plug & Drive interface*).

9.1 RS-485

The "Two-Wire Modbus Interface" electrical interface is supported by the controller in accordance with standard EIA/

TIA-485 (RS-485).

9.2 Modbus Modicon notation with PLCs

Many PLCs use the Modicon addressing model. This notation is not used in the Modbus standard.

The following address notation is relevant for Nanotec controllers:

- Input register 30001 - 39999 is mapped to Modbus telegram address 0 (0_h) - 9998 (270E_h).
- Holding register 40001 - 49999 is mapped to Modbus telegram address 0 (0_h) - 9998 (270E_h).

NOTE

Where Modbus addresses are mentioned in the manual, it may be necessary to implement the register addresses in the PLC in accordance with *Modicon notation*.

9.3 General

Modbus is generally big-endian based.

The only exceptions are the commands with function codes 43 (2B_h), 101 (65_h) and 102 (66_h), which are based on CANopen. For the data values of these commands, the little-endian format applies. The remainder of the Modbus message is, on the other hand, based on big-endian.

Example

Command 2B_h: With this command, the value 12345678_h is written in object 0123_h (does not exist):

SA	FC	Data	CRC
05	2B	0D 01 00 01 23 01 00 00 00 00 04 78 56 34 12	67 35

SA

Slave address

FC

Function code

Data

Data range, decoding is dependent on the used function code

CRC

Cyclic redundancy check

NOTE

In case of more than one Modbus slaves in the network, the Modbus master must wait for at least 3 ms after receiving a response before sending the next request.

TIP

To send a broadcast message to all nodes, use slave address "0". The controller does not respond in this case.

9.4 Function codes

The following "function codes" are supported:

	Name	Function code	Subfunction code
Data access (16-bit)	Read Holding Registers	03 (03 _h)	
	Read Input Register	04 (04 _h)	
	Write Single Register	06 (06 _h)	
	Write Multiple Registers	16 (10 _h)	
	Read/Write Multiple Registers	23 (17 _h)	
Diagnosis	Clear Counters and Diagnostic Register	08 (08 _h)	10 (0A _h)
	Return Bus Message Count	08 (08 _h)	11 (0B _h)
	Return Bus Communication Error Count	08 (08 _h)	12 (0C _h)
	Return Bus Exception Error Count	08 (08 _h)	13 (0D _h)
	Return Server Message Count	08 (08 _h)	14 (0E _h)
	Return Server No Response Count	08 (08 _h)	15 (0F _h)
	Return Server NAK Count	08 (08 _h)	16 (10 _h)
	Return Server Busy Count	08 (08 _h)	17 (11 _h)
	Return Bus Character Overrun Count	08 (08 _h)	18 (12 _h)
Miscellaneous	Encapsulated Interface Transport	43 (2B _h)	13 (0D _h)
	Read complete object dictionary start	101 (65 _h)	85 (55 _h)
	Read complete object dictionary next	101 (65 _h)	170 (AA _h)
	Read complete array or record start	102 (66 _h)	85 (55 _h)
	Read complete array or record next	102 (66 _h)	170 (AA _h)

9.5 Function code descriptions

9.5.1 FC 3 (03_h) Read Input Registers / FC 4 (04_h) Read Holding Registers

With this function code, one 16-bit value or multiple 16-bit values can be read. This function can be applied to NanoJ objects (see [NanoJ objects](#)) or process data objects (min. 4-byte alignment, see [Process data objects \(PDO\)](#)).

Request		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	03 _h / 04 _h
Start address	2 bytes	0000 _h to FFFF _h
Number of registers	2 bytes	1 to (7D _h)
CRC	2 bytes	

Response ("M" corresponds to the number of registers to be read)		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	03 _h / 04 _h
Number of bytes	1 byte	2 * M
Register value	2 bytes	
CRC	2 bytes	

Error		
Name	Length	Value
Slave address	1 byte	
Error code	1 byte	83 _h / 84 _h
Exception code (see Exception codes)	1 byte	01, 02, 03 or 04
CRC	2 bytes	

Example

Below is an example of a read request and response of register 5000 (1388_h) and of the following register (2 registers):

Request

SA	FC	Data	CRC
05	03	13 88 00 02	41 21

Response

SA	FC	Data	CRC
05	03	04 02 40 00 00	41 21

9.5.2 FC 6 (06_h) Write Single Register

This function code can be used to write a single 16-bit value. The function can be used on process data objects (see [Process data objects \(PDO\)](#)).

Request		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	06 _h
Register address	2 bytes	0000 _h to FFFF _h
Register value	2 bytes	0000 _h to FFFF _h
CRC	2 bytes	

Response		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	06 _h
Register address	2 bytes	0000 _h to FFFF _h
Register value	2 bytes	0000 _h to FFFF _h
CRC	2 bytes	

Error		
Name	Length	Value
Slave address	1 byte	
Error code	1 byte	86 _h
Exception code (see Exception codes)	1 byte	01, 02, 03 or 04
CRC	2 bytes	

Example

Below is an example of a write request and response in register 6000 (1770_h) with the value "0001_h":

Request

SA	FC	Data	CRC
05	06	17 70 00 01	4D E1

Response

SA	FC	Data	CRC
05	06	17 70 00 01	4D E1

9.5.3 FC 16 (10_h) Write Multiple Registers

With this function code, one 16-bit value or multiple 16-bit values can be written. The function can be applied to NanoJ objects (see [Process data objects \(PDO\)](#)) or process data objects (see [NanoJ objects](#)).

Request ("N" is the number of registers to be written)		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	10 _h
Start address	2 bytes	0000 _h to FFFF _h
Number of registers	2 bytes	0001 _h to 007B _h
Number of bytes	1 byte	2 * N
Register value	N * 2 bytes	
CRC	2 bytes	

Response		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	10 _h
Start address	2 bytes	0000 _h to FFFF _h
Number of registers	2 bytes	0001 _h to 007B _h
CRC	2 bytes	

Error		
Name	Length	Value
Slave address	1 byte	
Error code	1 byte	90 _h
Exception code (see Exception codes)	1 byte	01, 02, 03 or 04
CRC	2 bytes	

Example

Below is an example for writing values "0102_h" and "0304_h" starting with register address 6000 (1770_h), number of registers is 2, length of the data is 4:

Request

SA	FC	Data	CRC
05	10	17 70 00 02 04 01 02 03 04	AB 44

Response

SA	FC	Data	CRC
05	10	17 70 00 02	44 23

9.5.4 FC 17 (11_h) Report Server ID

This function code can be used to read the description of the type, the current status and other information about the device.

Request		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	11 _h
CRC	2 bytes	

Response		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	03 _h
Number of bytes	1 byte	01 _h
Run Indicator Status	1 byte	00 _h = OFF, FF _h = ON
Additional data		
CRC	2 bytes	

Error		
Name	Length	Value
Slave address	1 byte	
Error code	1 byte	91 _h
Exception code (see Exception codes)	1 byte	01 or 04
CRC	2 bytes	

Example

Below is an example of a request/response for ID and status:

Request

SA	FC	CRC
05	11	C2 EC

Response

SA	FC	Data	CRC
05	11	02 05 FF	0F EC

9.5.5 FC 23 (17_h) Read/Write Multiple registers

With this function code, one 16-bit value or multiple 16-bit values can be simultaneously read and written. The function can be applied to NanoJ objects (see [Process data objects \(PDO\)](#)) or process data objects (see [NanoJ objects](#)).

Request ("N" is the number of registers to be read):		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	17 _h
Read: Start address	2 bytes	0000 _h to FFFF _h
Read: Number of registers	2 bytes	0001 _h to 0079 _h
Write: Start address	2 bytes	0000 _h to FFFF _h
Write: Number of registers	2 bytes	0001 _h to 0079 _h
Write: Number of bytes	1 byte	2 * N
Write: Register value	N * 2 bytes	
CRC	2 bytes	

Response ("M" corresponds to the number of bytes to be written):		
Name	Length	Value
Slave address	1 byte	
Function code	1 byte	17 _h
Number of bytes	1 byte	2 * M
Registers read	M * 2 bytes	
CRC	2 bytes	

Error		
Name	Length	Value
Slave address	1 byte	
Error code	1 byte	97 _h
Exception code (see Exception codes)	1 byte	01, 02, 03 or 04
CRC	2 bytes	

Example

Below is an example for reading two registers beginning with register 5000 (1388_h) and for writing two registers beginning with register 6000 (1770_h) with 4 bytes and data "0102_h" and "0304_h":

Request

SA	FC	Data	CRC
05	17	13 88 00 02 17 70 00 02 04 01 02 03 04	56 6A

Response

SA	FC	Data	CRC
05	17	04 02 40 00 00	0F EC

9.5.6 FC 8 (08_h) Diagnostics

Modbus function code FC08 offers numerous tests for checking the communication system between client and server or for checking various internal error states within the server.

This function uses a two-byte subfunction code in the request for defining the type of test. In a normal response, the server repeats both, the function and the subfunction code. Some diagnoses contain data of the device in the data field of the normal response.

Request:

Name	Length	Value
Function code	1 byte	08 _h
Subfunction code	2 bytes	
Data	N x 2 bytes	

Response:

Name	Length	Value
Function code	1 byte	08 _h
Subfunction code	2 bytes	
Data	N x 2 bytes	

Error:

Name	Length	Value
Function code	1 byte	88 _h
Exception code (see Exception codes)	1 byte	01 or 03 or 04

9.5.6.1 FC 8.10 (08_h.0A_h) Clear Counters and Diagnostic Register

The objective of this request is to reset all counters and diagnosis registers. Counters are also reset when the controller is switched on.

Subfunction	Data range	
	Request	Response
00 _h 0A _h	00 _h - 00 _h	Echo of the request data

Example**Request**

SA	FC	Data	CRC
05	08	00 0A 00 00	56 6A

Response

SA	FC	Data	CRC
05	08	00 0A 00 00	C1 8D

9.5.6.2 FC 8.11 (08_h.0B_h) Return Bus Message Count

The response data range returns the number of messages detected by the communications system since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller.

Subfunction	Data range
Request	
Response	
00 _h 0B _h	00 _h - 00 _h Total Message Count

9.5.6.3 FC 8.12 (08_h.0C_h) Return Bus Communication Error Count

The response data range returns the number of CRC errors since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller.

Subfunction	Data range
Request	
Response	
00 _h 0C _h	00 _h - 00 _h CRC Error Count

Example**Request**

SA	FC	Data	CRC
05	08	00 0C 00 00	21 8C

Response

SA	FC	Data	CRC
05	08	00 0C 00 00	21 8C

9.5.6.4 FC 8.13 (08_h.0D_h) Return Bus Exception Error Count

The response data range returns the number of Modbus exceptions since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller.

Subfunction	Data range	
	Request	Response
00 _h 0D _h	00 _h - 00 _h	Exception Error Count

Example

Request

SA	FC	Data	CRC
05	08	00 0D 00 00	70 4C

Response

SA	FC	Data	CRC
05	08	00 0D 00 00	70 4C

9.5.6.5 FC 8.14 (08_h.0E_h) Return Server Message Count

The response data range returns the number of messages addressed to the device and the number of broadcast messages that were processed by the controller. The number of messages since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller are counted.

Subfunction	Data range	
	Request	Response
00 _h 0E _h	00 _h - 00 _h	Server Message Count

Example

Request

SA	FC	Data	CRC
05	08	00 0E 00 00	80 4C

Response

SA	FC	Data	CRC
05	08	00 0E 00 00	80 4C

9.5.6.6 FC 8.15 (08_h.0F_h) Return Server No Response Count

The response data range returns the number of messages addressed to the controller for which no response was returned (neither normal response nor exception response). The number of messages since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller are counted.

Subfunction	Data range	
	Request	Response
00 _h 0F _h	00 _h - 00 _h	No Response Count

Example

Request

SA	FC	Data	CRC
05	08	00 0F 00 00	D1 8C

Response

SA	FC	Data	CRC
05	08	00 0F 00 00	D1 8C

9.5.6.7 FC 8.16 (08_h-10_h) Return Server NAK Count

The response data range returns the number of messages for which a "Negative Acknowledge (NAK)" exception response was returned. The number of messages since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller are counted.

Subfunction	Data range	
	Request	Response
00 _h - 10 _h	00 _h - 00 _h	Server NAK Count

Example

Request

SA	FC	Data	CRC
05	08	00 10 00 00	E0 4A

Response

SA	FC	Data	CRC
05	08	00 10 00 00	E0 4A

9.5.6.8 FC 8.17 (08_h-11_h) Return Server Busy Count

The response data range returns the number of messages for which a "Server Device Busy" exception response was returned. The number of messages since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller are counted.

Subfunction	Data range	
	Request	Response
00 _h - 11 _h	00 _h - 00 _h	Server NAK Count

Example**Request**

SA	FC	Data	CRC
05	08	00 11 00 00	B1 8A

Response

SA	FC	Data	CRC
05	08	00 11 00 00	B1 8A

9.5.6.9 FC 8.18 (08_h.12_h) Return Bus Character Overrun Count

The response data range returns the number of messages addressed to the controller that could not be processed due to a character overrun. The number of messages since the last restart, "Clear Counters and Diagnostic Register" request, or switching on of the controller are counted. A character overrun occurs when characters arrive at the controller faster than they can be stored or by the loss of a character due to a hardware malfunction.

Subfunction	Data range	
	Request	Response
00 _h - 12 _h	00 _h - 00 _h	Server Character Overrun Count

Example**Request**

SA	FC	Data	CRC
05	08	00 12 00 00	41 8A

Response

SA	FC	Data	CRC
05	08	00 12 00 00	41 8A

9.5.7 FC 43 (2B_h) Encapsulated Interface Transport

This function facilitates simple access of the CANopen object dictionary. Further details can be found in the following documentation:

1. *MODBUS APPLICATION PROTOCOL SPECIFICATION V1.1b3*, Date: 26.04.2014, Version: 1.1b3

2. CiA 309 Draft Standard Proposal - Access from other networks - Part 2: Modbus/TCP mapping V1.3, Date: 30.07.2015, Version: 1.3

NOTE

For the messages of the Encapsulated Interface Transport, another byte sequence applies in part, see chapter [General](#).

Definition of the request and response:

Name	Length	Example/number range
Slave address	1 byte	
Function code	1 byte	2B _h (43 _d)
MEI type	1 byte	0D _h (13 _d)
Protocol options Range	2 to 5 bytes	
Address and data range	N bytes	
CRC	2 bytes	

Protocol options Range

Name	Length	Example/number range
Protocol control	1 to 2 bytes	See description
Reserved	1 byte	Always 0
(Optional) Counter byte	1 byte	
(Optional) Network ID	1 byte	
(Optional) Encoded data	1 byte	

Protocol control:

The "Protocol control" field contains the flags that are needed for controlling the message protocols. The bytes of the "Protocol control" field are defined as follows if the "extended" flag was set (the second byte is otherwise omitted):

The most significant bit (MSB) is bit 0 for "protocol control" byte 1 and bit 8 for "protocol control" byte 2. The least significant bit (LSB) is bit 7 for "protocol control" byte 1 and bit 15 for "protocol control" byte 2.

Bit	Name	Description
0	"Extended" flag	This bit is used if the object dictionary data set is larger than would fit in a Modbus command. The data set then spans over multiple Modbus messages; each message contains part of the data set. "0" = No multiple message transaction or the end of the multiple message transaction. "1" = Part of a multiple message transaction.

Bit	Name	Description
1	Extended protocol control	Length of the protocol control, the value "0" indicates a length of 1 byte, the value "1" indicates a length of 2 bytes.
2	Counter byte option	This bit is set to "1" to indicate that the "counter byte" field is used in this message. If this bit is set to "0", the "counter byte" field does not exist in this message.
3 and 4	Reserved	0
5	Network ID option	Not supported, must be "0".
6	Encoded data option	Not supported, must be "0".
7	Access flag	This bit indicates the access method of the requested command. "0" = read, "1" = write.
8 to 15	Reserved	0

Address and data range

The address and data range is defined in the following table:

Name	Byte size and byte order	Example / range
Node-ID	1 byte	01 _h to 7F _h
Index	1 byte, high	0000 _h to FFFF _h
	1 byte, low	
Subindex	1 byte	00 _h to FF _h
Start address	1 byte, high	0000 _h to FFFF _h
	1 byte, low	
Number of data values	1 byte, high	0000 _h to 00FD _h
	1 byte, low	
Write/read data	n bytes	The data are encoded as described in chapter <u>General</u> .

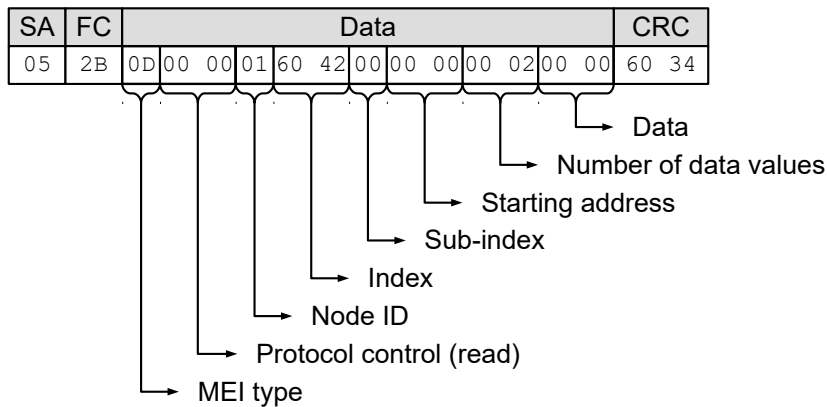

Example:

To read object 6042_h:00_h (16-bit value), the following message must be sent by the master (all values are in hexadecimal notation, the slave ID of the controller is "5").

Request

Response

Shown as an additional example below, a sequence of Modbus messages is sent from the master to the slave to rotate the motor in "Velocity" mode:

Set 6060 = "02_h" (Velocity mode)

Request

SA	FC	Data										CRC			
05	2B	0D	01	00	01	60	60	00	00	00	00	01	02	C9	2F

Response

SA	FC	Data										CRC			
05	2B	0D	01	00	01	60	60	00	00	00	00	00	00	A9	89

Set 2031 = 03E8_h" (1000 mA)

Request

SA	FC	Data										CRC						
05	2B	0D	01	00	01	20	31	00	00	00	00	04	E8	03	00	00	C3	53

Response

SA	FC	Data										CRC			
05	2B	0D	01	00	01	20	31	00	00	00	00	00	00	E5	CC

Set 6040 = "00_h"

Request

SA	FC	Data										CRC				
05	2B	0D	01	00	01	60	40	00	00	00	00	02	00	00	1C	2E

Response

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 00	AE E9

Set 6040 = "80_h"**Request**

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 02 80 00	7D EE

Response

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 00	AE E9

Set 6040 = "06_h"**Request**

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 02 06 00	1F 8E

Response

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 00	AE E9

Set 6040 = "07_h"**Request**

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 02 07 00	1E 1E

Response

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 00	AE E9

Set 6040 = "0F_h"**Request**

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 02 0F 00	19 DE

Response

SA	FC	Data	CRC
05	2B	0D 01 00 01 60 40 00 00 00 00 00	AE E9

Below are two examples for reading an object:

Read 6041_h:00_h

Request

SA	FC	Data	CRC
05	2B	0D 00 00 01 60 41 00 00 00 00 02	7F 3C

Response

SA	FC	Data	CRC
05	2B	0D 00 00 01 60 41 00 00 00 00 02 37 06	B6 13

Read 6061_h:00_h

Request

SA	FC	Data	CRC
05	2B	0D 00 00 01 60 61 00 00 00 00 01	38 5D

Response

SI	FC	Data	CRC
05	2B	0D 00 00 01 60 61 00 00 00 00 01 00	5C D2

9.5.7.1 Error reaction

In the event of an error, the following error message is sent:

Name	Length	Example value
Slave address	1 byte	
Function code	1 byte	2B _h + 80 _h (171 _d = 43 _d + 128 _d) (indicates error)
Modbus exception code	1 byte	FF _h ("extended exception")
Extended exception length	2 bytes	6
MEI type	1 byte	0D _h
Exception code	1 byte	CE _h
Error code	4 bytes	CANopen error code, see following table
CRC	2 bytes	

CANopen error code	Description
FFFF0000 _h	Abort no error

CANopen error code	Description
FFFF1003 _h	Service is not supported
FFFF1004 _h	Gap in counter byte of the <i>Protocol control</i> field
FFFF0003 _h	Unknown or invalid command
FFFF0008 _h	Access to the object is not supported
FFFF000E _h	General error in the parameter
FFFF0011 _h	Length of parameter incorrect
FFFF0012 _h	Parameter too long
FFFF0013 _h	Parameter too short
FFFF0015 _h	Parameter data outside of the permissible value range (for write commands)
FFFF0016 _h	Parameter data exceed the permissible value range (for write commands)
FFFF0017 _h	Parameter data below the permissible value range (for write commands)
FFFF0018 _h	Maximum entered values less than minimum values
FFFF0019 _h	General error
FFFF001E _h	Requested object is too large for single message
FFFF1004 _h	Invalid sequence of messages (e. g., if the value of the <i>counter byte</i> is not correct according to the previous request or response)

In the event that the unsupported control option bit is set, the following error message is sent:

Name	Length	Example value
Slave address	1 byte	
Function code	1 byte	2B _h + 80 _h (171 _d = 43 _d + 128 _d) (indicates error)
Modbus exception code	1 byte	FF _h ("extended exception")
Extended exception length	2 bytes	2 + length of "supported protocol control"
MEI type	1 byte	0D _h
Exception code	1 byte	AE _h
Supported protocol control	1 or 2 bytes	See following table
CRC	2 bytes	

Bit	Name	Description
0	"Extended" flag	This bit is used if the object dictionary data set is larger than would fit in a Modbus command. The data set then spans over multiple Modbus messages; each message contains part of the data set. "0" = No multiple message transaction or the end of the multiple message transaction. "1" = Part of a multiple message transaction.
1	Extended protocol control	Length of the protocol control, the value "0" indicates a length of 1 byte, the value "1" indicates a length of 2 bytes.
2	Counter byte option	This bit is set to "1" to indicate that the "counter byte" field is used in this message. If this bit is set to "0", the "counter byte" field does not exist in this message.

Bit	Name	Description
3 and 4	Reserved	0
5	Network ID option	Not supported, must be "0".
6	Encoded data option	Not supported, must be "0".
7	Access flag	This bit indicates the access method of the requested command. "0" = read, "1" = write.
8 to 15	Reserved	0

The following example shows an error in the event of a faulty request. The request reads 6061_h:00 with a length of 2 bytes, but the object has a size of just 1 byte:

Request

SA	FC	Data	CRC
05	2B	0D 00 00 01 60 60 00 00 00 00 02	79 8D

Response

SA	FC	Data	CRC
05	2B	FF 00 06 0D CE 12 00 07 06	AC 3C

9.5.8 FC 101 (65_h) Read complete object dictionary

This function code is used to read out the complete object dictionary.

To start or restart the reading out of the object dictionary, subfunction code 55_h must be sent. This code resets reading out of the object dictionary on object 0000_h. All subsequent object dictionary frames must then contain subfunction code AA_h. At the end, once all objects have been read out, an "Error Response" is generated with the abort code "No data available".

The format of each "read object" is as follows:

Request:

Name	Length	Value / note
Slave address	1 byte	
Function code	1 byte	65 _h
Subfunction code	1 byte	55 _h or AA _h
Length of the data	1 byte	00 _h
CRC	2 bytes	

Response:

Name	Length	Value / note
Slave address	1 byte	65 _h
Function code	1 byte	
Subfunction code	1 byte	
Length of the data	1 byte	
n times "object dictionary frame"	1 - 252 bytes	
CRC	2 bytes	

An object dictionary frame consists of the following bytes:

Name	Value / note	
Index Low Byte	1 byte	
Index High Byte	1 byte	
Subindex	1 byte	
Number of bytes	1 byte	Number m of the valid data in the data field
Data byte	m-1 byte	

Example

All of the following numerical values are in hexadecimal format. The address of the slave is "5".

Start reading of the object dictionary with request:

SA	FC	Data	CRC
05	65	55 00	2F A7

The response is:

Read out the next part of the object dictionary with the request:

SA	FC	Data	CRC
05	65	AA 00	6E 57

The response is:

SA	FC	Data	CRC
05	65	AA CD 21 00 0A 02 07 00 21 00 0B 02 07 00 21 00 0C 02 ...	NN NN

Repeat reading of the object dictionary with the previous request until the response is an error:

SA	FC	Data	CRC
05	E5	0D	EA 94

9.5.8.1 Error reaction

In the event of an error, the following error message is sent:

Name	Length	Example value
Slave address	1 byte	
Function code	1 byte	2B _h + 80 _h (171 _d = 43 _d + 128 _d) (indicates error)
Modbus exception code	1 byte	FF _h ("extended exception")
Extended exception length	2 bytes	6
MEI type	1 byte	0D _h
Exception code	1 byte	CE _h
Error code	4 bytes	CANopen error code, see following table
CRC	2 bytes	

CANopen error code	Description
FFFF0000 _h	<i>Abort no error</i>
FFFF1003 _h	Service is not supported
FFFF1004 _h	Gap in counter byte of the <i>Protocol control</i> field
FFFF0003 _h	Unknown or invalid command
FFFF0008 _h	Access to the object is not supported
FFFF000E _h	General error in the parameter
FFFF0011 _h	Length of parameter incorrect
FFFF0012 _h	Parameter too long
FFFF0013 _h	Parameter too short
FFFF0015 _h	Parameter data outside of the permissible value range (for write commands)
FFFF0016 _h	Parameter data exceed the permissible value range (for write commands)
FFFF0017 _h	Parameter data below the permissible value range (for write commands)
FFFF0018 _h	Maximum entered values less than minimum values
FFFF0019 _h	General error
FFFF001E _h	Requested object is too large for single message
FFFF1004 _h	Invalid sequence of messages (e. g., if the value of the <i>counter byte</i> is not correct according to the previous request or response)

In the event that the unsupported control option bit is set, the following error message is sent:

Name	Length	Example value
Slave address	1 byte	
Function code	1 byte	2B _h + 80 _h (171 _d = 43 _d + 128 _d) (indicates error)
Modbus exception code	1 byte	FF _h ("extended exception")
Extended exception length	2 bytes	2 + length of "supported protocol control"
MEI type	1 byte	0D _h
Exception code	1 byte	AE _h
Supported protocol control	1 or 2 bytes	See following table
CRC	2 bytes	

Bit	Name	Description
0	"Extended" flag	This bit is used if the object dictionary data set is larger than would fit in a Modbus command. The data set then spans over multiple Modbus messages; each message contains part of the data set. "0" = No multiple message transaction or the end of the multiple message transaction. "1" = Part of a multiple message transaction.
1	Extended protocol control	Length of the protocol control, the value "0" indicates a length of 1 byte, the value "1" indicates a length of 2 bytes.
2	Counter byte option	This bit is set to "1" to indicate that the "counter byte" field is used in this message. If this bit is set to "0", the "counter byte" field does not exist in this message.
3 and 4	Reserved	0
5	Network ID option	Not supported, must be "0".
6	Encoded data option	Not supported, must be "0".
7	Access flag	This bit indicates the access method of the requested command. "0" = read, "1" = write.
8 to 15	Reserved	0

The following example shows an error in the event of a faulty request. The request reads $6061_{\text{h}}:00$ with a length of 2 bytes, but the object has a size of just 1 byte:

Request

SA	FC	Data	CRC
05	2B	0D 00 00 01 60 60 00 00 00 00 02	79 8D

Response

SA	FC	Data	CRC
05	2B	FF 00 06 0D CE 12 00 07 06	AC 3C

9.5.9 FC 102 (66_h) Read complete array or record

This function code is used to read out the complete array or record from the object dictionary.

To start or restart the reading out of the array, subfunction code 55_{h} must be sent. This code resets reading out on the object with subindex 00_{h} . All subsequent requests must then contain subfunction code AA_{h} . At the end, once all objects have been read out, an "Error Response" is generated.

The format of each "read object" is as follows:

Request:

Name	Length	Value / note
Slave address	1 byte	
Function code	1 byte	66_{h}
Subfunction code	1 byte	55_{h} or AA_{h}
Length of the data	1 byte	00_{h}
Index of the array to be read	2 bytes	
CRC	2 bytes	

Response:

Name	Length	Value / note
Slave address	1 byte	65 _h
Function code	1 byte	
Subfunction code	1 byte	
Length of the data	1 byte	
n times object dictionary frame	1 - 252 bytes	
CRC	2 bytes	

An object dictionary frame consists of the following bytes:

Name	Value / note
Index Low Byte	1 byte
Index High Byte	1 byte
Subindex	1 byte
Number of bytes	1 byte Number m of the valid data in the data field
Data byte	m-1 byte

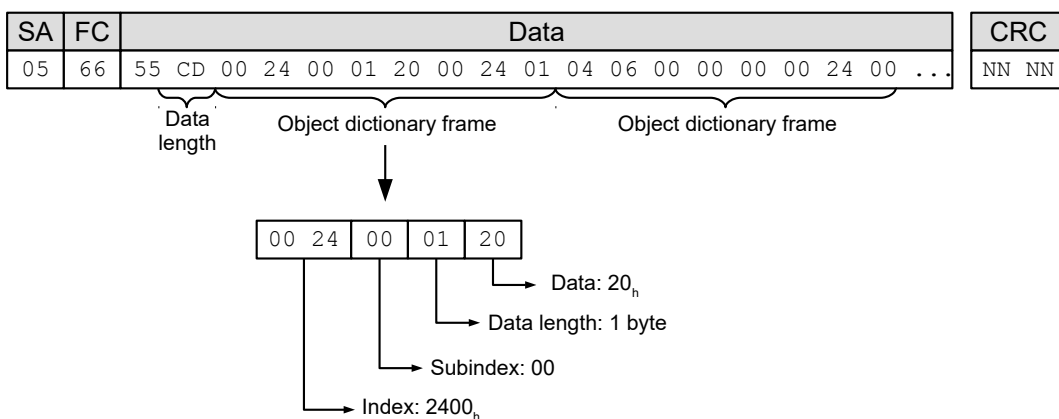

Example

All of the following numerical values are in hexadecimal format; the index of the object that is to be read is 2400_h. The address of the slave is "5"_h.

Start reading of the array with request:

SA	FC	Data	CRC
05	66	55 00 24 00	02 8A

The response is:

9.5.9.1 Error reaction

In the event of an error, the following error message is sent:

Name	Length	Example value
Slave address	1 byte	
Function code	1 byte	2B _h + 80 _h (171 _d = 43 _d + 128 _d) (indicates error)
Modbus exception code	1 byte	FF _h ("extended exception")
Extended exception length	2 bytes	6
MEI type	1 byte	0D _h
Exception code	1 byte	CE _h
Error code	4 bytes	CANopen error code, see following table
CRC	2 bytes	

CANopen error code	Description
FFFF0000 _h	<i>Abort no error</i>
FFFF1003 _h	Service is not supported
FFFF1004 _h	Gap in counter byte of the <i>Protocol control</i> field
FFFF0003 _h	Unknown or invalid command
FFFF0008 _h	Access to the object is not supported
FFFF000E _h	General error in the parameter
FFFF0011 _h	Length of parameter incorrect
FFFF0012 _h	Parameter too long
FFFF0013 _h	Parameter too short
FFFF0015 _h	Parameter data outside of the permissible value range (for write commands)
FFFF0016 _h	Parameter data exceed the permissible value range (for write commands)
FFFF0017 _h	Parameter data below the permissible value range (for write commands)
FFFF0018 _h	Maximum entered values less than minimum values
FFFF0019 _h	General error
FFFF001E _h	Requested object is too large for single message
FFFF1004 _h	Invalid sequence of messages (e. g., if the value of the <i>counter byte</i> is not correct according to the previous request or response)

In the event that the unsupported control option bit is set, the following error message is sent:

Name	Length	Example value
Slave address	1 byte	
Function code	1 byte	2B _h + 80 _h (171 _d = 43 _d + 128 _d) (indicates error)
Modbus exception code	1 byte	FF _h ("extended exception")
Extended exception length	2 bytes	2 + length of "supported protocol control"
MEI type	1 byte	0D _h
Exception code	1 byte	AE _h
Supported protocol control	1 or 2 bytes	See following table
CRC	2 bytes	

Bit	Name	Description
0	"Extended" flag	This bit is used if the object dictionary data set is larger than would fit in a Modbus command. The data set then spans over multiple Modbus messages; each message contains part of the data set. "0" = No multiple message transaction or the end of the multiple message transaction. "1" = Part of a multiple message transaction.
1	Extended protocol control	Length of the protocol control, the value "0" indicates a length of 1 byte, the value "1" indicates a length of 2 bytes.
2	Counter byte option	This bit is set to "1" to indicate that the "counter byte" field is used in this message. If this bit is set to "0", the "counter byte" field does not exist in this message.
3 and 4	Reserved	0
5	Network ID option	Not supported, must be "0".
6	Encoded data option	Not supported, must be "0".
7	Access flag	This bit indicates the access method of the requested command. "0" = read, "1" = write.
8 to 15	Reserved	0

The following example shows an error in the event of a faulty request. The request reads $6061_{\text{h}}:00$ with a length of 2 bytes, but the object has a size of just 1 byte:

Request

SA	FC	Data	CRC
05	2B	0D 00 00 01 60 60 00 00 00 00 02	79 8D

Response

SA	FC	Data	CRC
05	2B	FF 00 06 0D CE 12 00 07 06	AC 3C

9.5.10 Exception codes

In case of an error, the following exception codes may be contained in the response depending on the function code:

Code	Name	Description
01	Illegal Function	Function code not recognized/allowed
02	Illegal Data Address	Register address not valid or does not exist
03	Illegal Data Value	Value not valid
04	Device Failure	Unrecoverable error

For further details, refer to Modbus specification *MODBUS APPLICATION PROTOCOL SPECIFICATION V1.1b3*.

9.6 Process data objects (PDO)

As with CANopen, a process image can be configured for input and output values with Modbus. This image only contains the data values of one or more objects without additional information, such as length, index or subindex. A single message can thereby be used to read or write multiple objects at the same time.

9.6.1 Configuration

The configuration of the image is referred to as "mapping" and is written in the following objects:

- 3502_h for the Modbus Rx (master → slave) PDO mapping
- 3602_h for Modbus Tx (slave → master) PDO mapping

Both objects contain an array of 16 entries each. Subindex 00 specifies the number of valid entries here.

Objects 3502_h and 3602_h can be written with messages with Modbus function code 2B_h.

9.6.2 Transfer

The data are written sequentially in the message without gaps and alignment.

If alignment is required (e.g., 16-bit alignment), additional "dummy objects" can be incorporated in the message. Dummy objects are only ever transferred with the data value "0". These objects are listed in the following table.

Index	Data type
0002 _h	Signed integer (8 bit)
0003 _h	Signed integer (16 bit)
0004 _h	Signed integer (32 bit)
0005 _h	Unsigned integer (8 bit)
0006 _h	Unsigned integer (16 bit)
0007 _h	Unsigned integer (32 bit)

Mapping is as follows:

- The PDO RX image begins at Modbus register address 6000_d (1770_h).
- The PDO TX image begins at Modbus register address 5000_d (1388_h).

Read/write access can be performed simultaneously with function code 17_h or with the 03_h, 04_h, 06_h, 10_h commands on the respective RX/TX images.

NOTE

To be able to change the mapping, you must first deactivate it by setting the corresponding subindex 0_h to "0".

After writing the objects to the respective subindices, enter the number of mapped objects in subindex 0_h.

Example

The following objects are to be set in the mapping:

- 3602_h:00_h = "0_h" (mapping is deactivated)
- 3602_h:01_h = "60410010_h" (object 6041_h:00_h, length 16 bits is mapped)
- 3602_h:02_h = "00050008_h" (dummy object 0005_h:00_h, length 8 bits is mapped)
- 3602_h:03_h = "60610008_h" (object 6061_h:00_h, length 8 bits is mapped)
- 3602_h:04_h = "60640020_h" (object 6064_h:00_h, length 32 bits is mapped)

- 3602_h:05_h = "60440010_h" (object 6044_h:00_h, length 16 bits is mapped)
- 3602_h:06_h = "60FD0020_h" (object 60FD_h:00_h, length 32 bits is mapped)
- 3602_h:00_h = "6_h" (6 values are mapped)

After the mapping for object 6061_h:00_h, a dummy object is inserted so that the next object 6064_h:00_h can be aligned to 32 bit.

Rx message: The master sends the slave the following message:

SA	FC	Data	CRC
05	04	13 88 00 07	34 E2

Tx message: The slave sends following response to the master:

SA	FC	Data	CRC
05	04	0E 06 40 00 02 00 00 00 00 00 00 00 00 00 00 00	1C 98

9.7 NanoJ objects

NanoJ objects 2400_h NanoJ Input and 2500_h (NanoJ Output) are, like the process image, mapped to the Modbus register:

- 2500_h with 32 x 32 bit values is mapped to the Modbus register address beginning with 2000_d (BB8_h) and can only be read in this way.
- 2400_h with 32 x 32 bit values is mapped to the Modbus register address beginning with 3000_d (7D0_h) and can only be written in this way.

To access, commands with function codes 03_h, 04_h, 10_h and 17_h can be used. For purposes of data consistency, the restriction that the address must be 32-bit aligned and that at least 32 bits must always be written during a write operation applies.

Example

Request: The master sends the slave the following message:

SA	FC	Data	CRC
05	17	07 D0 00 08 0B B8 00 08 10 00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F	41 21

Reply: The slave sends the master the following response:

SA	FC	Data	CRC
05	17	10 00	50 9D

10 Programming with NanoJ

NanoJ is a programming language similar to C or C++. *NanoJ* is integrated in the *Plug & Drive Studio* software. You can find further information in document *Plug & Drive Studio: Quick Start Guide* at us.nanotec.com.

10.1 NanoJ program

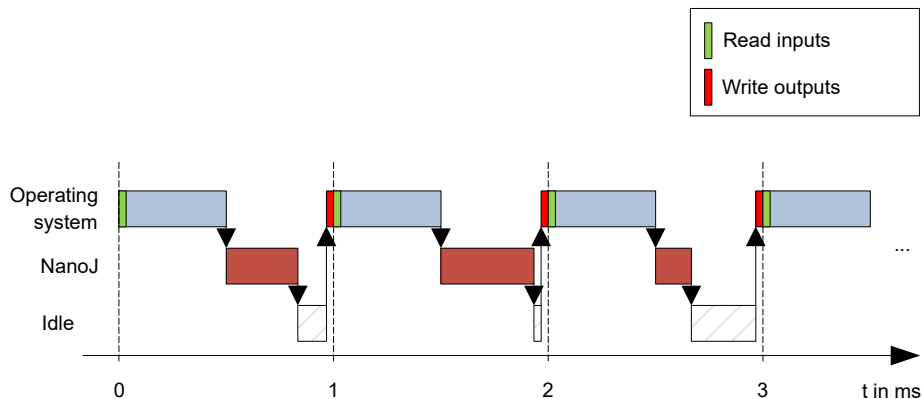

A *NanoJ* program makes a protected runtime environment available within the firmware. Here, the user can create his own processes. These can then trigger functions in the controller by, for example, reading or writing entries in the object dictionary.

Through the use of protective mechanisms, a *NanoJ* program is prevented from crashing the firmware. In the worst case, the execution is interrupted with an error code stored in the object dictionary.

If the *NanoJ* program was loaded on the controller, it is automatically executed after the controller is switched on or restarted, as long as you do not set bit 0 in object `2300h` to "0".

10.1.1 Available computing time

A *NanoJ* program receives computing time cyclically in a 1 ms clock (see following figure). Because computing time is lost through interrupts and system functions of the firmware, only approx. 30% – 50% of computing time is available to the user program (depending on control mode and application). In this time, the user program must run through the cycle and either complete the cycle or yield the computing time by calling the `yield()` function. In the former case, the user program is restarted with the start of the next 1 ms cycle; the latter results in the program being continued on the next 1 ms cycle with the command that follows the `yield()` function.

If the *NanoJ* program needs more time than was allotted, it is ended and an error code set in the object dictionary.

TIP

When developing user programs, the runtime behavior must be carefully examined, especially for more time-intensive tasks. For example, it is therefore recommended that tables be used instead of calculating a sine value using a `sin` function.

NOTE

If the *NanoJ program* does not yield the computing time after too long a time, it is ended by the operating system. In this case, the number 4 is entered in the statusword for object 2301_h; in the error register for object 2302_h, the number 5 (timeout) is noted, see [2301h NanoJ Status](#) and [2302h NanoJ Error Code](#).

To keep the *NanoJ program* from stopping, you can activate *AutoYield* mode by writing value "5" in [2300_h](#). In *AutoYield* mode, however, the *NanoJ program* is no longer real-time capable and no longer runs every 1 ms.

10.1.2 Protected runtime environment

Using process-specific properties, a so-called *protected runtime environment* is generated. A user program in the protected runtime environment is only able to access specially allocated memory areas and system resources. For example, an attempt to directly write to a processor IO register is acknowledged with an *MPU Fault* and the user program terminated with the corresponding error code in the object dictionary.

10.1.3 NanoJ program – communication possibilities

A *NanoJ program* has a number of possibilities for communicating with the controller:

- Read and write OD values using PDO mapping
- Directly read and write OD values via NanoJ functions
- Call other NanoJ functions (e.g., write [debug output](#))

The OD values of the user program are made available in the form of variables via *PDO mapping*. Before a user program receives the 1 ms time slot, the firmware transfers the values from the object dictionary to the variables of the user program. As soon as the user program receives computing time, it can manipulate these variables as regular C variables. At the end of the time slot, the new values are then automatically copied by the firmware back to the respective OD entries.

To optimize the performance, three types of mapping are defined: input, output, and input/output (In, Out, InOut).

- *Input mappings* can only be read; they are not transferred back to the object dictionary.
- *Output mappings* can only be written.
- *Input/output mappings*, on the other hand, can both be read and written.

The set mappings can be read and checked via the GUI for objects 2310_h, 2320_h, and 2330_h. Up to 16 entries are allowed for each mapping.

Whether a variable is stored in the input, output or data range is controlled in *Plug & Drive Studio* via the specification of the *linker section*.

NanoJ inputs and NanoJ outputs

To communicate with the *NanoJ program* via the respective interface, you can use the following objects:

- [2400h NanoJ Inputs](#): Array with thirty-two S32 values for passing values to the *NanoJ program*
- [2410h NanoJ Init Parameters](#): Array with thirty-two S32 values. This object can be stored, unlike 2400_h.
- [2500h NanoJ Outputs](#): Array with thirty-two S32 values, where the *NanoJ program* can store values that can be read out via the fieldbus

10.1.4 Executing a NanoJ program

When executing a cycle, the *NanoJ program* essentially consists of the following three steps with respect to the PDO mapping:

1. Read values from the object dictionary and copy them to the input and output areas
2. Execute a user program
3. Copy values from the output and input areas back to the object dictionary

The configuration of the copy processes is based on the CANopen standard.

In addition, values of the object dictionary can be accessed via NanoJ functions. This is generally slower; mappings are therefore to be preferred. The number of mappings is limited (16 entries each in In/Out/InOut).

TIP

Nanotec recommends: Map OD entries that are used and changed frequently and use NanoJ function to access OD entries that are used less frequently.

A list of available NanoJ functions can be found in chapter [NanoJ functions in the NanoJ program](#).

TIP

Nanotec recommends accessing a given OD value either by mapping or using a NanoJ function with `od_write()`. If both are used simultaneously, the NanoJ function has no effect.

10.1.5 NanoJ program – OD entries

The *NanoJ program* is controlled and configured in object range 2300_h to 2330_h (see [2300h NanoJ Control](#)).

OD-Index	Name and description
2300 _h	2300h NanoJ Control
2301 _h	2301h NanoJ Status
2302 _h	2302h NanoJ Error Code
2310 _h	2310h NanoJ Input Data Selection
2320 _h	2320h NanoJ Output Data Selection
2330 _h	2330h NanoJ In/output Data Selection

Example:

To start the *TEST1.USR* user program, the following sequence can, for example, be used:

- Check entry 2302_h for error code.
- If no error:
Start the *NanoJ program* by writing object 2300_h, bit 0 = "1" or by restarting the controller.

NOTE

It can take up to 200 ms for the NanoJ program to start.

- Check entry 2302_h for error code and object 2301_h, bit 0 = "1".

NOTE

Due to limitations in the USB implementation, file "VMMCODE.USR" is, following a restart of the controller, set to a size of 16 kB and the creation date set to 13.03.2012.

To stop a running program: write entry 2300_h with bit 0 value = "0".

10.1.6 Structure of a NanoJ program

A user program consists of at least two instructions:

- the preprocessor instruction `#include "wrapper.h"`
- the `void user() {}` function

The code to be executed can be stored in the `void user()` function.

NOTE

The file names of the user programs must not be longer than eight characters plus three characters in the suffix; file name `main.cpp` is permissible, file name `aLongFileName.cpp` is not permissible.

NOTE

In *NanoJ programs*, global variables may only be initialized within functions. It then follows:

- No `new` operator
- No constructors
- No initialization of global variables outside of functions

Examples:

The global variable is to be initialized within the `void user()` function:

```
unsigned int i;
void user(){
  i = 1;
  i += 1;
}
```

The following assignment is not correct:

```
unsigned int i = 1;
void user() {
  i += 1;
}
```

10.1.7 NanoJ program example

The example shows the programming of a square wave signal in object `2500h:01h`.

```
// file main.cpp
map S32 outputReg1 as inout 0x2500:1
#include "wrapper.h"

// user program
void user()
{
  U16 counter = 0;
  while( 1 )
  {
    ++counter;

    if( counter < 100 )
      InOut.outputReg1 = 0;
    else if( counter < 200 )
      InOut.outputReg1 = 1;
    else
      counter = 0;
  }
}
```

```
// yield() 5 times (delay 5ms)
for(U08 i = 0; i < 5; ++i )
    yield();
}
} // eof
```

You can find other examples at us.nanotec.com.

10.2 Mapping in the NanoJ program

With this method, a variable in the *NanoJ* program is linked directly with an entry in the object dictionary. The creation of the mapping must be located at the start of the file here, even before the `#include "wrapper.h"` instruction.

TIP

Nanotec recommends:

- Use mapping if you need to access an object in the object dictionary frequently, e. g., *controlword* 6040_h or *statusword* 6041_h.
- The `od_write()` and `od_read()` functions are better suited for accessing objects a single time, see [Accessing the object dictionary](#).

10.2.1 Declaration of the mapping

The declaration of the mapping is structured as follows:

```
map <TYPE> <NAME> as <input|output|inout> <INDEX>:<SUBINDEX>
```

Where:

■ <TYPE>

The data type of the variable; U32, U16, U08, S32, S16 or S08.

■ <NAME>

The name of the variable as it is used in the user program.

■ <input|output|inout>

The read and write permission of a variable: a variable can be declared as an *input*, *output* or *inout*. This defines whether a variable is readable (*input*), writable (*output*) or both (*inout*) and the structure by means of which it must be addressed in the program.

■ <INDEX>:<SUBINDEX>

Index and subindex of the object to be mapped in the object dictionary.

Each declared variable is addressed in the user program via one of the three structures: *In*, *Out* or *InOut* depending on the defined write and read direction.

NOTE

A comment is only permitted above the respective mapping declaration in the code, not on the same line.

10.2.2 Example of mapping

Example of a mapping and the corresponding variable accesses:

```
// 6040h:00h is UNSIGNED16
map U16 controlWord as output 0x6040:00
// 6041h:00h is UNSIGNED16
map U16 statusWord as input 0x6041:00

// 6060h:00h is SIGNED08 (INTEGER8)
map S08 modeOfOperation as inout 0x6060:00

#include "wrapper.h"

void user()
{
  [...]
  Out.controlWord = 1;
  U16 tmpVar = In.statusword;
  InOut.modeOfOperation = tmpVar;
  [...]
}
```

10.2.3 Possible error at `od_write()`

A possible source of errors is a write access with the `od_write()` function (see [NanoJ functions in the NanoJ program](#)) of an object in the object dictionary that was simultaneously created as mapping. The code listed in the following is incorrect:

```
map U16 controlWord as output 0x6040:00
#include " wrapper.h"
void user()
{
  [...]
  Out.controlWord = 1;
  [...]
  od_write(0x6040, 0x00, 5 ); // der Wert wird durch das Mapping überschrieben
  [...]
}
```

The line with the `od_write(0x6040, 0x00, 5);` command has no effect. As described in the introduction, all mappings are copied to the object dictionary at the end of each millisecond.

This results in the following sequence:

1. The `od_write` function writes the value 5 in object 6040h:00h.
2. At the end of the 1 ms cycle, the mapping is written that also specifies object 6040h:00h, however, with the value 1.
3. From the perspective of the user, the `od_write` command thus serves no purpose.

10.3 NanoJ functions in the NanoJ program

With NanoJ functions, it is possible to call up functions integrated in the firmware directly from a user program. Code can only be directly executed in the protected area of the protected execution environment and is realized via so-called *Cortex Supervisor Calls* (Svc Calls). Here, an interrupt is triggered when the function is called, thereby giving the firmware the possibility to temporarily permit code execution outside of the protected execution environment. Developers of user programs do not need to worry about this mechanism – for them, the NanoJ functions can be called up like normal C functions. Only the `wrapper.h` file needs to be integrated as usual.

10.3.1 Accessing the object dictionary

void **od_write** (U32 index, U32 subindex, U32 value)

This function writes the transferred value to the specified location in the object dictionary.

index	Index of the object to be written in the object dictionary
subindex	Subindex of the object to be written in the object dictionary
value	Value to be written

NOTE

It is highly recommended that the processor time be passed on with `yield()` after calling a `od_write()`. The value is immediately written to the OD. For the firmware to be able to trigger actions that are dependent on this, however, it must receive computing time. This, in turn, means that the user program must either be ended or interrupted with `yield()`.

U32 **od_read** (U32 index, U32 subindex)

This function reads the value at the specified location in the object dictionary and returns it.

index	Index of the object to be read in the object dictionary
subindex	Subindex of the object to be read in the object dictionary
Output value	Content of the OD entry

NOTE

Active waiting for a value in the object dictionary should always be associated with a `yield()`.

Example

```
while (od_read(2400,2) != 0) // wait until 2400:2 is set
{ yield(); }
```

10.3.2 Process control

```
void yield()
```

This function returns the processor time to the operating system. In the next time slot, the program continues at the location after the call.

```
void sleep (U32 ms)
```

This function returns the processor time to the operating system for the specified number of milliseconds. The user program is then continued at the location after the call.

ms	Time to be waited in milliseconds
----	-----------------------------------

10.3.3 Debug output

The following functions output a value in the debug console. They differ with respect to the data type of the parameter to be passed.

```
bool VmmDebugOutputString (const char *outstring)
```

```
bool VmmDebugOutputInt (const U32 val)
```

```
bool VmmDebugOutputByte (const U08 val)
```

```
bool VmmDebugOutputHalfWord (const U16 val)
```

```
bool VmmDebugOutputWord (const U32 val)
```

```
bool VmmDebugOutputFloat (const float val)
```

NOTE

The debug outputs are first written to a separate area of the object dictionary and read from there by the *Plug & Drive Studio*.

This OD entry has index 2600_h and is 64 characters long, see [2600h NanoJ Debug Output](#). Subindex 00 always contains the number of characters already written.

If the buffer is full, `VmmDebugOutputxxx()` initially fails; execution of the user program ceases and it stops at the location of the debug output. Only after the GUI has read the buffer and after subindex 00 has been reset does the program continue and `VmmDebugOutputxxx()` returns to the user program.

NOTE

Debug outputs may therefore only be used during the test phase when developing a user program.

NOTE

Do not use the debug output if *AutoYield* mode is activated (see [Available computing time](#)).

10.4 Restrictions and possible problems

Restrictions and possible problems when working with NanoJ are listed below:

Restriction/problem	Measure
If an object is mapped, e.g., 0x6040, the object is reset to its previous value every 1 ms. This makes it impossible to control this object via the fieldbus or the <i>Plug & Drive Studio</i> .	Instead use <code>od_read/od_write</code> to access the object.
If an object was mapped as output and the value of the object was never defined before starting the <i>NanoJ program</i> , the value of this object may be random.	Initialize the values of the mapped objects in your NanoJ program to ensure that it behaves deterministically.

Restriction/problem	Measure
The array initialization must not be used with more than 16 entries.	Use <code>constant array</code> instead.
<code>float</code> must not be used with comparison operators.	Use <code>int</code> instead.
<code>double</code> must not be used.	
If a NanoJ program restarts the controller (either directly with an explicit restart or indirectly, e. g., through the use of the Reset function), the controller may fall into a restart loop that can be exited only with difficulty if at all.	
<code>math</code> or <code>cmath</code> cannot be included.	

11 Description of the object dictionary

11.1 Overview

This chapter contains a description of all objects.

You will find information here on:

- Functions
- Object descriptions ("Index")
- Value descriptions ("Subindices")
- Descriptions of bits
- Description of the object

11.2 Structure of the object description

The description of the object entries always has the same structure and usually consists of the following sections:

Function

The function of the object dictionary is briefly described in this section.

Object description

This table provides detailed information on the data type, preset values and similar. An exact description can be found in section "[Object description](#)"

Value description

This table is only available with the "Array" or "Record" data type and provides exact information about the sub-entries. A more exact description of the entries can be found in section "[Value description](#)"

Description

Here, more exact information on the individual bits of an entry is provided or any compositions explained. A more exact description can be found in section "[Description](#)"

11.3 Object description

The object description consists of a table that contains the following entries:

Index

Designates the object index in hexadecimal notation.

Object name

The name of the object.

Object Code

The type of object. This can be one of the following entries:

- VARIABLE: In this case, the object consists of only a variable that is indexed with subindex 0.
- ARRAY: These objects always consists of a subindex 0 – which specifies the number of sub-entries – and the sub-entries themselves, beginning with index 1. The data type within an array never changes, i.e., sub-entry 1 and all subsequent entries are always of the same data type.
- RECORD: These objects always consists of a subindex 0 – which specifies the number of sub-entries – and the sub-entries themselves, beginning with index 1. Unlike an ARRAY, the data type of the sub-entries can vary. This means that, e.g., sub-entry 1 may be of a different data type than sub-entry 2.

- **VISIBLE_STRING**: The object describes a character string coded in ASCII. The length of the string is specified in subindex 0; the individual characters are stored beginning in subindex 1. These character strings are **not** terminated by a null character.

Data type

The size and interpretation of the object is specified here. The following notation is used for the "VARIABLE" object code:

- A distinction is made between entries that are signed; these are designated with the prefix "SIGNED". For entries that are unsigned, the prefix "UNSIGNED" is used.
- The size of the variable in bits is placed before the prefix and can be 8, 16 or 32.

Savable

Described here is whether this object is savable and, if so, in which category.

Firmware version

The firmware version beginning with which the object is available is entered here.

Change history (ChangeLog)

Any changes to the object are noted here.

There are also the following table entries for the "VARIABLE" data type:

Access

The access restriction is entered here. The following restrictions are available:

- "read/write": The object can both be read as well as written
- "read only": The object can only be read from the object dictionary. It is not possible to set a value.

PDO mapping

Some bus systems, such as CANopen or EtherCAT, support PDO mapping. Described in this table entry is whether the object can be inserted into a mapping and, if so, into which. The following designations are available here:

- "no": The object may not be entered in a mapping.
- "TX-PDO": The object may be entered in an RX mapping.
- "RX-PDO": The object may be entered in a TX mapping.

Allowed values

In some cases, only certain values may be written in the object. If this is the case, these values are listed here. If there are no restrictions, the field is empty.

Preset value

To bring the controller to a secured state when switching on, it is necessary to preset a number of objects with values. The value that is written in the object when the controller is started is noted in this table entry.

11.4 Value description

NOTE

For the sake of clarity, a number of subindices are grouped together if the entries all have the same name.

Listed in the table with the "Value description" heading are all data for sub-entries with subindex 1 or higher. The table contains the following entries:

Subindex

Number of the currently written sub-entry.

Name

Name of the sub-entry.

Data type

The size and interpretation of the sub-entry is specified here. The following notation always applies here:

- A distinction is made between entries that are signed; these are designated with the prefix "SIGNED". For entries that are unsigned, the prefix "UNSIGNED" is used.
- The size of the variable in bits is placed before the prefix and can be 8, 16 or 32.

Access

The access restriction for the sub-entry is entered here. The following restrictions are available:

- "read/write": The object can both be read as well as written
- "read only": The object can only be read from the object dictionary. It is not possible to set a value.

PDO mapping

Some bus systems, such as CANopen or EtherCAT, support PDO mapping. Described in this table entry is whether the sub-entry can be inserted into a mapping and, if so, into which. The following designations are available here:

- "no": The object may not be entered in a mapping.
- "TX-PDO": The object may be entered in an RX mapping.
- "RX-PDO": The object may be entered in a TX mapping.

Allowed values

In some cases, only certain values may be written in the sub-entry. If this is the case, these values are listed here. If there are no restrictions, the field is empty.

Preset value

To bring the controller to a secured state when switching on, it is necessary to preset a number of sub-entries with values. The value that is written in the sub-entry when the controller is started is noted in this table entry.

11.5 Description

This section may be present if use requires additional information. If individual bits of an object or sub-entry have different meaning, diagrams as shown in the following example are used.

Example: The object is 8 bits in size; bit 0 and bit 1 have different functions. Bits 2 and 3 are grouped into one function; the same applies for bits 4 to 7.

7	6	5	4	3	2	1	0
Example [4]				Example [2]		B	A

Example [4]

Description of bit 4 up to and including bit 7; these bits are logically related. The 4 in square brackets specifies the number of related bits. A list with possible values and their description is often attached at this point.

Example [2]

Description of bits 3 and 2; these bits are logically related. The 2 in square brackets specifies the number of related bits.

- Value 00_b: The description here applies if bit 2 and bit 3 are "0".
- Value 01_b: The description here applies if bit 2 is "0" and bit 3 is "1".
- Value 10_b: The description here applies if bit 2 is "1" and bit 3 is "0".
- Value 11_b: The description here applies if bit 2 and bit 3 are "1".

B

Description of bit B; no length is specified for a single bit.

A

Description of bit A; bits with a gray background are not used.

1000h Device Type

Function

Describes the controller type.

Object description

Index	1000 _h
Object name	Device Type
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	no
Allowed values	
Preset value	00060192 _h
Firmware version	FIR-v1426
Change history	

Description

Motor Type[16]

Describes the supported motor type. The following values are possible:

- Bit 23 to bit 16: Value "2": BLDC motor
- Bit 23 to bit 16: Value "4": Stepper motor
- Bit 23 to bit 16: Value "6": Stepper motor as well as BLDC motor

Device profile number[16]

Describes the supported CANopen standard.

Values:

0192_h or 0402_d (preset value): The CiA 402 standard is supported.

1001h Error Register

Function

Error register: The corresponding error bit is set in case of an error. If the error no longer exists, it is deleted automatically.

NOTE

For each error that occurs, a more precise error code is stored in object 1003_h.

Object description

Index	1001 _h
Object name	Error Register
Object Code	VARIABLE
Data type	UNSIGNED8

Description

General function

If a new error occurs, it is entered in subindex 1. The already existing entries in subindices 1 to 7 are moved back one position. The error in subindex 7 is thereby removed.

The number of errors that have already occurred can be read from the object with subindex 0. If no error is currently entered in the error stack, it is not possible to read one of the eight subindices 1–8 and an error (abort code = 08000024_h) is sent in response. If a "0" is written in subindex 0, counting starts again from the beginning.

Bit description

Error Number [8]

This can be used to pinpoint the cause of the error. The meaning of the number can be found in the following table.

Error number	Description
0	Watchdog-Reset
1	Input voltage (+Ub) too high
2	Output current too high
3	Input voltage (+Ub) too low
4	Error at fieldbus
6	CANopen only: NMT master takes too long to send Nodeguarding request
7	Sensor 1 (see 3204 _h): Error through electrical fault or defective hardware
8	Sensor 2 (see 3204 _h): Error through electrical fault or defective hardware
9	Sensor 3 (see 3204 _h): Error through electrical fault or defective hardware
10	Warning: Positive limit switch exceeded
11	Warning: Negative limit switch exceeded
12	Overtemperature error
13	The values of object 6065 _h (Following Error Window) and object 6066 _h (Following Error Time Out) were exceeded; a fault was triggered.
14	Warning: Nonvolatile memory full. The current save process could not be completed; parts of the data of the save process are lost. Controller must be restarted for cleanup work.
15	Motor blocked
16	Warning: Nonvolatile memory damaged; controller must be restarted for cleanup work (all saved objects are reset to default).
17	CANopen only: Slave took too long to send PDO messages.

Error number	Description
18	Sensor n (see 3204_h), where n is greater than 3: Error through electrical fault or defective hardware
19	CANopen only: PDO not processed due to a length error
20	CANopen only: PDO length exceeded
21	Warning: Restart the controller to avoid future errors when saving (nonvolatile memory full/corrupt).
22	Rated current must be set (203B _h :01 _h /6075 _h)
23	Encoder resolution, number of pole pairs and some other values are incorrect.
24	Motor current is too high, adjust the PI parameters.
25	Internal software error, generic
26	Current too high at digital output
27	CANopen only: Unexpected sync length
30	Error in speed monitoring: slippage error too large
32	Internal error: Correction factor for reference voltage missing in the OTP
40	Warning: Ballast resistor thermally overloaded
46	Interlock error: Bit 3 in 60FD _h is set to "0", the motor may not start (see the section <i>Interlock function</i> in the chapter Digital inputs)

Error Class[8]

This byte is identical to object [1001_h](#)

Error Code[16]

Refer to the following table for the meaning of the bytes.

Error Code	Description
1000 _h	General error
2300 _h	Current at the controller output too large
3100 _h	Overvoltage/undervoltage at controller input
4200 _h	Temperature error within the controller
5540 _h	Interlock error: Bit 3 in 60FD _h is set to "0", the motor may not start (see the section <i>Interlock function</i> in the chapter Digital inputs)
6010 _h	Software reset (watchdog)
6100 _h	Internal software error, generic
6320 _h	Rated current must be set (203B _h :01 _h /6075 _h)
7113 _h	Warning: Ballast resistor thermally overloaded
7121 _h	Motor blocked
7200 _h	Internal error: Correction factor for reference voltage missing in the OTP
7305 _h	Sensor 1 (see 3204_h) faulty
7306 _h	Sensor 2 (see 3204_h) faulty
7307 _h	Sensor n (see 3204_h), where n is greater than 2
7600 _h	Warning: Nonvolatile memory full or corrupt; restart the controller for cleanup work
8100 _h	Error during fieldbus monitoring
8130 _h	CANopen only: "Life Guard" error or "Heartbeat" error

Error Code	Description
8200 _h	CANopen only: Slave took too long to send PDO messages.
8210 _h	CANopen only: PDO was not processed due to a length error
8220 _h	CANopen only: PDO length exceeded
8240 _h	CANopen only: unexpected sync length
8400 _h	Error in speed monitoring: slippage error too large
8611 _h	Position monitoring error: Following error too large
8612 _h	Position monitoring error: Limit switch exceeded

1005h COB-ID Sync

Function

Defines the COB-ID of the SYNC message for the SYNC protocol. The value must correspond to an 11-bit-long CAN-ID and is evaluated when the controller is restarted or on a Reset Communication command.

NOTE

If the CAN-ID is not to correspond to the default value of 80_h, it must be ensured that only not-yet unassigned or reserved CAN-IDs are used.

You can activate the generation of sync messages (the controller becomes the *sync master of the network*) by setting bit 30 to "1". Set the cycle time in object 1006_h.

Object description

Index	1005 _h
Object name	COB-ID Sync
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: communication
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000080 _h
Firmware version	FIR-v1426
Change history	

1006h Communication Cycle Period

Function

Contains the cycle time for the generated sync messages (see 1005_h) in μ s. Only multiples of 1000 μ s are permitted.

Object description

Index	1006 _h
Object name	Communication Cycle Period
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: communication
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v2013-B726332
Change history	

1007h Synchronous Window Length

Function

This object contains the length of the time window in microseconds for synchronous PDOs. If the synchronous time window has elapsed, all synchronous TxPDOs are rejected and an EMCY message sent. The RxPDOs are also rejected up to the next SYNC message.

The value "0" switches off the time window, thereby allowing the PDOs to be sent at any time.

This object is only available in device variants with CANopen connection.

Object description

Index	1007 _h
Object name	Synchronous Window Length
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: communication
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426

100Ah Manufacturer Software Version

Function

This object contains the software version as character string.

Object description

Index	100A _h
Object name	Manufacturer Software Version
Object Code	VARIABLE
Data type	VISIBLE_STRING
Savable	no
Access	read only
PDO mapping	no

Allowed values	
Preset value	FIR-v2139-B1019507
Firmware version	FIR-v1426
Change history	

100Ch Guard Time

Function

Object 100C_h multiplied by object [100Dh Live Time Factor](#) yields the so-called lifetime for the Lifeguarding / Nodeguarding protocol. The value is specified in milliseconds. See also [Nodeguarding](#).

NOTE

The *Heartbeat protocol* has a higher priority than *Nodeguarding*. If both protocols are activated simultaneously, the Node Guarding Timer is suppressed, but no EMCY message is sent either.

Object description

Index	100C _h
Object name	Guard Time
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: communication
Access	read / write
PDO mapping	no
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

100Dh Live Time Factor

Function

This object is a multiplier which, multiplied by object [100C_h](#), yields the time window for the *Nodeguarding* protocol in milliseconds. See also [Nodeguarding](#).

NOTE

The *Heartbeat protocol* has a higher priority than *Nodeguarding*. If both protocols are activated simultaneously, the Node Guarding Timer is suppressed, but no EMCY message is sent either.

This object is only available in device variants with CANopen connection.

Object description

Description

Each subindex of the object stands for a certain memory class. By reading out the entry, it is possible to determine whether (value "1") or not (value="0") this memory category can be saved.

To start the save process of a memory category, value "65766173_h" must be written in the corresponding subindex. This corresponds to the decimal of 1702257011_d or the ASCII string *save*. As soon as the saving process is completed, the save command is again overwritten with the value "1", since saving is possible again.

For a detailed description, see chapter [Saving objects](#).

1011h Restore Default Parameters

Function

This object can be used to reset all or part of the object dictionary to the default values. See chapter [Saving objects](#).

--------------	-----------------------

Description

If the value 64616F6C_h (or 1684107116_d or ASCII `load`) is written in this object, part or all of the object dictionary is reset to the default values. The subindex that is used decides which range is reset.

For a detailed description, see chapter [Discarding the saved data](#).

1014h COB-ID EMCY

Function

This object describes the COB-ID of the "Emergency Service" under CANopen.

With the *Valid Bit* (bit 31) = "1", the [Emergency Service](#) can be deactivated; the service is active with the value "0". Every time the controller is restarted, bits 0 to 30 are generated according to the node-ID.

Object description

Index	1014 _h
Object name	COB-ID EMCY
Object Code	VARIABLE
Data type	UNSIGNED32

Firmware version	FIR-v1426
Change history	Firmware version FIR-v1540: "Access" table entry for subindex 00 changed from "read only" to "read/write".

1016h Consumer Heartbeat Time

Function

This object defines the cycle time of the *Consumer Heartbeat* of the *Network Management* CANopen service and the Node-ID of the *Producer* of the *Heartbeat*.

If the cycle time or node-ID is set to the value 0, there is no response to the Heartbeat message. See also chapter [Heartbeat](#).

Object description

Index	1016 _h

Subindex	01 _h
Name	Consumer Heartbeat Time
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h

Description

Subindex 01_h contains:

- Bits 0 to 15: The time of the *Consumer Heartbeat* in ms.
- Bits 16 to 23: The node-ID of the *Producer* whose *Heartbeat* is to be monitored.

1017h Producer Heartbeat Time

Function

This object defines the cycle time of the *Heartbeat* of the *Network Management* CANopen service in milliseconds. If the object is set to the value 0, no Heartbeat message is sent. See also [Heartbeat](#).

NOTE

The *Heartbeat protocol* has a higher priority than *Nodeguarding*. If both protocols are activated simultaneously, the Node Guarding Timer is suppressed, but no EMCY message is sent either.

This object is only available in device variants with CANopen connection.

Description

Allowed values: 02_h to F0_h.

1020h Verify Configuration

Function

This object indicates the date and time that the configuration was stored.

A configuration tool or a master can use this object to verify the configuration after a reset and, if necessary, perform a new configuration.

The tool must set the date and time before the storage mechanism is started (see chapter [Saving objects](#)).

Object description

Preset value	00 _h

Subindex	02 _h
Name	Internal Device Error
Data type	UNSIGNED8
Access	read / write
PDO mapping	no
Allowed values	
Preset value	01 _h

Description

The subindices have the following function:

- 01_h: This subindex is used to define how to respond in case of a communication error:
 - Value "00"_h: The controller switches to the *Pre-Operational* state (if previously in the *Operational* state).
 - Value "01"_h: The controller does not change state.
 - Value "02"_h: The controller switches to the *Stopped* state.
- 02_h: This subindex is used to define how to respond to the remaining errors (except for communication errors):
 - Value "00"_h: The controller switches to the *Pre-Operational* state (if previously in the *Operational* state).
 - Value "01"_h: The controller does not change state.
 - Value "02"_h: The controller switches to the *Stopped* state.

1400h Receive PDO 1 Communication Parameter

Function

Contains the communication parameters for the receiving-side mapping (RX-PDO) in object 1600_h. See chapter [Process Data Object \(PDO\)](#).

Object description

Name	Transmission Type
Data type	UNSIGNED8
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FF _h

Description

Subindex 01_h (COB-ID): The COB-ID is stored here.

Subindex 02_h (transmission type): A number is stored in this subindex that defines the time at which the received data become valid.

For details see chapter on [configuring the RX-PDO mapping](#).

1401h Receive PDO 2 Communication Parameter

Function

Contains the communication parameters for the receiving-side mapping (RX-PDO) in object 1601_h. See chapter [Process Data Object \(PDO\)](#).

Object description

Index	1401 _h
Object name	Receive PDO 2 Communication Parameter
Object Code	RECORD
Data type	PDO_COMMUNICATION_PARAMETER
Savable	yes, category: communication
Firmware version	FIR-v1426
Change history	

Value description

Description

Each subindex (1–8) describes a different mapped object.

A mapping entry consists of four bytes, which are structured according to the following graphic.

Index [16]

This contains the index of the object to be mapped.

Subindex [8]

This contains the subindex of the object to be mapped.

Length [8]

This contains the length of the object to be mapped in units of bits.

1601h Receive PDO 2 Mapping Parameter

Function

This object contains the mapping parameters for PDOs that the controller can receive (RX-PDO 2). The PDO was previously configured via [1401h Receive PDO 2 Communication Parameter](#). See chapter [Process Data Object \(PDO\)](#).

1607h Receive PDO 8 Mapping Parameter

Function

This object contains the mapping parameters for PDOs that the controller can receive (RX-PDO 8). The PDO was previously configured via [1407h Receive PDO 8 Communication Parameter](#). See chapter [Process Data Object \(PDO\)](#).

Object description

Index	1607 _h

Description

Subindex 01_h (COB-ID): The COB-ID is stored here.

Subindex 02_h (transmission type): A number is stored in this subindex that defines the time at which the received data become valid.

Subindex 3 (inhibit time): This can be used to set a time in 100 µs steps that must elapse after the sending of a PDO before the PDO is sent another time. This time only applies for asynchronous PDOs.

Subindex 4 (compatibility entry): This subindex has no function and exists only for compatibility reasons.

Subindex 5 (event timer): This time (in ms) can be used to trigger an *Event* which handles the copying of the data and the sending of the PDO.

Subindex 6 (sync start value): Here, the start value of the *Sync Counter* is entered beginning with which the *slave* is to initially respond to the sync and send the PDO. Thereafter, sending of the PDO is only dependent on *Transmission Type* (subindex 02_h). Not globally activated until a value greater than 1 is set in 1019h Synchronous Counter Overflow Value.

For details, see chapter on configuring the Tx-PDO mapping.

1801h Transmit PDO 2 Communication Parameter

Function

Contains the communication parameters for the sending-side mapping (TX-PDO) 2. See chapter Process Data Object (PDO).

Subindex	08 _h
Name	8th Object To Be Mapped
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h

Description

Each subindex (1–8) describes a different mapped object.

A mapping entry consists of four bytes, which are structured according to the following graphic.

**Index [16]**

This contains the index of the object to be mapped.

Subindex [8]

This contains the subindex of the object to be mapped.

Length [8]

This contains the length of the object to be mapped in units of bits.

1A01h Transmit PDO 2 Mapping Parameter

Function

This object contains the mapping parameters for PDOs that the controller can send (TX-PDO 2). The PDO was previously configured via [1801h Transmit PDO 2 Communication Parameter](#). See chapter [Process Data Object \(PDO\)](#).

Object description

Index	1A01 _h
Object name	Transmit PDO 2 Mapping Parameter
Object Code	RECORD
Data type	PDO_MAPPING
Savable	yes, category: communication
Firmware version	FIR-v1426
Change history	<p>Firmware version FIR-v1426: "Heading" entry changed from "1A01h Positioning Status" to "1A01h Transmit PDO 2 Mapping Parameter".</p> <p>Firmware version FIR-v1426: "Object Name" entry changed from "Positioning Status" to "Transmit PDO 2 Mapping Parameter".</p>

1F80h NMT Startup

Function

In this object you can set whether, after starting the controller, the state is automatically switched to the NMT state *Operational*. See also chapter [Network Management \(NMT\)](#).

Object description

Index	1F80 _h
-------	-------------------

Object name	NMT Startup
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: communication
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1748-B531667
Change history	

Description

- Value "0"_h: The state of the NMT state machine after initialization is *Pre-Operational*.
- Value "8"_h (bit 3): The state of the NMT state machine after initialization is *Operational*.

2005h CANopen Baudrate

Function

This object contains the baud rate of the CANopen bus.

Object description

Index	2005 _h
Object name	CANopen Baudrate
Object Code	VARIABLE
Data type	UNSIGNED8
Savable	yes, category: CANopen
Access	read / write
PDO mapping	no
Allowed values	
Preset value	88 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1748-B531667: "Savable" entry changed from "yes, category: communication" to "yes, category: CANopen".

Description

The baud rates are to be set according to the following table. Each value outside of this table is interpreted as 1000 kBd.

Value		Baud rate in kBd
dec	hex	
129	81	10
130	82	20
131	83	50
132	84	125

Value		Baud rate in kBd
dec	hex	
133	85	250
134	86	500
136	88	1000

2007h CANopen Config

Function

This object can be used to perform various settings for CANopen.

Object description

Index	2007 _h
Object name	CANopen Config
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: CANopen
Access	read only
PDO mapping	no
Allowed values	
Preset value	
Firmware version	FIR-v1540
Change history	Firmware version FIR-v1748-B531667: "Savable" entry changed from "yes, category: communication" to "yes, category: CANopen".

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	01 _h
Subindex	01 _h
Name	BL Config
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h

Description

The subindices have the following functions:

- Subindex 01: If the value "1" is written in the object, the boot loader suppresses the boot-up message and only the firmware sends a BOOTUP message. With a "0", the boot loader and the firmware each send a BOOTUP message.

2009h CANopen NodeID

Function

This object contains the node-ID of the controller. See chapter *Commissioning*.

Object description

Index	2009 _h
Object name	CANopen NodeID
Object Code	VARIABLE
Data type	UNSIGNED8
Savable	yes, category: CANopen
Access	read / write
PDO mapping	no
Allowed values	
Preset value	7F _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1748-B531667: "Savable" entry changed from "yes, category: communication" to "yes, category: CANopen".

2028h MODBUS Slave Address

Function

This object contains the slave address for Modbus. See chapter *Communication settings*.

Object description

Index	2028 _h
Object name	MODBUS Slave Address
Object Code	VARIABLE
Data type	UNSIGNED8
Savable	yes, category: Modbus RTU
Access	read / write
PDO mapping	no
Allowed values	1-247
Preset value	05 _h
Firmware version	FIR-v1436
Change history	Firmware version FIR-v1748-B531667: "Savable" entry changed from "yes, category: communication" to "yes, category: Modbus RTU".

202Ah MODBUS RTU Baudrate

Function

This object contains the baud rate of the Modbus in Bd. See chapter [Communication settings](#).

Object description

Index	202A _h
Object name	MODBUS RTU Baudrate
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: Modbus RTU
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00004B00 _h
Firmware version	FIR-v1436
Change history	Firmware version FIR-v1748-B531667: "Savable" entry changed from "yes, category: communication" to "yes, category: Modbus RTU".

202Ch MODBUS RTU Stop Bits

Function

This object contains the number of stop bits of the Modbus.

Object description

Index	202C _h
Object name	MODBUS RTU Stop Bits
Object Code	VARIABLE
Data type	UNSIGNED8
Savable	no
Access	read only
PDO mapping	no
Allowed values	
Preset value	01 _h
Firmware version	FIR-v1436
Change history	Firmware version FIR-v1540: "Savable" entry changed from "yes, category: communication" to "no". Firmware version FIR-v1540: "Access" table entry for subindex 00 changed from "read/write" to "read only".

Description

The number of stop bits is dependent on the parity, which can be set in object [202D_h](#).

202Dh MODBUS RTU Parity

Function

For Modbus RTU, this object sets the number of parity bits and stop bits.

Object description

Index	202D _h
Object name	MODBUS RTU Parity
Object Code	VARIABLE
Data type	UNSIGNED8
Savable	yes, category: Modbus RTU
Access	read / write
PDO mapping	no
Allowed values	
Preset value	04 _h
Firmware version	FIR-v1540
Change history	Firmware version FIR-v1748-B531667: "Savable" entry changed from "yes, category: communication" to "yes, category: Modbus RTU".

Description

The following values apply:

- Value "0x00": Parity None, Stop Bits 2
- Value "0x04": Parity Even, Stop Bits 1
- Value "0x06": Parity Odd, Stop Bits 1

2030h Pole Pair Count

Function

Contains the number of pole pairs of the connected motor.

Object description

Index	2030 _h
Object name	Pole Pair Count
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: tuning
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000032 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1540: "Savable" entry changed from "no" to "yes, category: tuning".

2031h Max Motor Current

Function

Enter the maximum permissible motor current in milliamperes here. All current values are limited by this value.

Within the controller, the entered value is always interpreted as the root mean square.

Object description

Index	2031 _h
Object name	Max Motor Current
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: tuning
Access	read / write
PDO mapping	no
Allowed values	
Preset value	0000012C _h
Firmware version	FIR-v1426
Change history	<p>Firmware version FIR-v1614: "Savable" entry changed from "yes, category: application" to "yes, category: tuning".</p> <p>Firmware version FIR-v1614: "Object Name" entry changed from "Peak Current" to "Max Current".</p> <p>Firmware version FIR-v1748-B538662: "Object Name" entry changed from "Maximum Current" to "Max Motor Current".</p> <p>Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Max Motor Current" to "Maximum Current".</p> <p>Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Maximum Current" to "Max Motor Current".</p> <p>Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Max Motor Current" to "Maximum Current".</p> <p>Firmware version FIR-v1825-B577172: "Object Name" entry changed from "Maximum Current" to "Max Motor Current".</p>

2034h Upper Voltage Warning Level

Function

This object contains the threshold value for the "overvoltage" error in millivolts.

Object description

Index	2034 _h
Object name	Upper Voltage Warning Level
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application

Access	read / write
PDO mapping	no
Allowed values	
Preset value	0000EDB3 _h
Firmware version	FIR-v1426
Change history	

Description

If the input voltage of the controller exceeds this threshold value, the motor is switched off and an error triggered. This error is reset automatically if the input voltage is less than (voltage of object 2034_h minus 2 volts).

2035h Lower Voltage Warning Level

Function

This object contains the threshold value for the "Undervoltage" error in millivolts.

Object description

Index	2035 _h
Object name	Lower Voltage Warning Level
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00002710 _h
Firmware version	FIR-v1426
Change history	

Description

If the input voltage of the controller falls below this threshold value, the motor is switched off and an error triggered. The error is reset automatically if the input voltage exceeds the voltage of object 2035_h plus 1.5 volts.

2036h Open Loop Current Reduction Idle Time

Function

This object describes the time in milliseconds that the motor must be at a standstill before current reduction is activated.

Object description

Index	2036 _h
Object name	Open Loop Current Reduction Idle Time
Object Code	VARIABLE

Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	000003E8 _h
Firmware version	FIR-v1426
Change history	

2037h Open Loop Current Reduction Value/factor

Function

This object describes the rms current to which the motor current is to be reduced if current reduction is activated in open loop (bit 3 in 3202_h = "1") and the motor is at a standstill.

Object description

Index	2037 _h
Object name	Open Loop Current Reduction Value/factor
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FFFFFFCE _h
Firmware version	FIR-v1426
Change history	

Description

Value of 2037_h greater than or equal to 0 and less than value 6075_h

Current is reduced to the value entered here. The value is in mA and interpreted as root mean square.

Value of 2037_h in the range from -1 to -100

The entered value is interpreted as a percentage and determines the reduction of the rated current in 2037_h. The value in 6075_h is used for the calculation.

Example: Object 6075_h has the value 4200 mA. The value -60 in 2037_h reduces the current by 60% of 6075_h. The result is a current reduction to a root mean square of 6075_h * (2037_h + 100) / 100 = 1680 mA.

The value -100 in 2037_h would, for example, mean that a current reduction is set to a root mean square of 0 mA.

2038h Brake Controller Timing

Function

This object contains the times for the *brake control* in milliseconds as well as the PWM frequency and the duty cycle.

Object description

Index	2038 _h
Object name	Brake Controller Timing
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application

Name	PWM Duty Cycle
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	0, between 2 and 100 (64 _h)
Preset value	00000000 _h

Description

The subindices have the following functions:

- 01_h: Time between motor standstill and the closing of the brake.
- 02_h: Time between the closing of the brake and the switching off of the motor current.
- 03_h: Time between the switching on of the motor current and opening of the brake.
- 04_h: Time between the opening of the brake and when the *Operation enabled* state of the [CiA 402 Power State Machine](#) is reached.
- 05_h: Frequency of the PWM signal in hertz.
- 06_h: Duty cycle of the PWM signal in percent.

2039h Motor Currents

Function

This object contains the measured motor currents in mA. All values are peak values, (#2*rms).

Object description

Index	2039 _h
Object name	Motor Currents
Object Code	ARRAY
Data type	INTEGER32

Subindex	01 _h
Name	Minimum Current For Block Detection
Data type	INTEGER32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	<ul style="list-style-type: none"> ■ CL4-E-1-12: 000002EE_h ■ CL4-E-2-12: 000005DC_h ■ CL4-E-1-12-5VDI: 000002EE_h ■ CL4-E-2-12-5VDI: 000005DC_h

Subindex	02 _h
Name	Block Detection Time
Data type	INTEGER32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	000000C8 _h

Description

The subindices have the following function:

- 01_h: Specifies the current limit value above which blocking is to be detected. Positive numerical values specify the current limit in mA, negative numbers specify a percentage of object 2031_h. Example: The value "1000" corresponds to 1000 mA (= 1 A); the value "-70" corresponds to 70% of 2031_h.
- 02_h: Specifies the time in ms that the motor is to continue to travel against the block after block detection.

203Bh I2t Parameters

Function

This object contains the parameters for I²t monitoring.

I²t monitoring is activated by entering a value greater than 0 in 203B_h:01 and 203B_h:02 and a value greater than 1000 in 6073_h (see [I2t Motor overload protection](#)).

With one exception, I²t monitoring can only be used for *closed loop* mode: If I²t is activated in *open loop* mode, the current is reduced to the smaller of 203B_h:01_h, 6073_h and 2031_h.

Description

The subindices are divided into two groups: subindex 01_h and 02_h contain parameters for control, subindices 03_h to 06_h are status values. The functions are as follows:

- 01_h: The rated current specified in the motor data sheet is entered here in mA. This must be smaller than the current entered in 2031_h and 6073_h, otherwise monitoring is not activated. The specified value is interpreted as root mean square.
- 02_h: Specifies the maximum duration of the maximum current (6073_h) in ms.
- 03_h: Threshold, specifies the limit in A²ms that determines whether the maximum current or rated current is switched to.
- 04_h: CalcValue, specifies the calculated value in A²ms that is compared with the threshold for setting the current.
- 05_h: LimitedCurrent, contains the momentary current as root mean square set by I²t.
- 06_h: Current status. If the sub-entry value is "0", I²t is deactivated; if the value is "1", I²t is activated.

203Dh Torque Window

Function

Specifies a symmetrical range relative to the target torque within which the target is considered having been met.

If the value is set to "FFFFFFF"_h, monitoring is switched off, the "Target reached" bit in object 6041_h (statusword) is never set.

Object description

203Fh Max Slippage Time Out

Function

Time in milliseconds until an excessively large slippage error in Profile Velocity mode results in an error message.

Object description

Index	203F _h
Object name	Max Slippage Time Out
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0064 _h
Firmware version	FIR-v1738-B501312
Change history	

Description

If the actual speed deviates so much from the set speed that the value (absolute value) of the object `60F8h` (Max Slippage) is exceeded, bit 13 in object `6041h` is set. The deviation must last longer than the time in object `203Fh`.

A reaction to the slippage error can be set in object `3700h`. If a reaction is defined, an error is also entered in object `1003h`.

2057h Clock Direction Multiplier

Function

The clock count value in Clock-direction mode is multiplied by this value before it is processed further.

Subindex	02 _h
Name	Fieldbus Module Enabled
Data type	UNSIGNED32
Access	read only
PDO mapping	no
Allowed values	
Preset value	0019000B _h

Description

Subindex 1 (Fieldbus Module Disable Mask): This subindex contains all physical interfaces and protocols that can be activated or deactivated. A value "1" means that this fieldbus can be deactivated.

Subindex 2 (Fieldbus Module Enabled): This subindex contains all currently activated physical interfaces and protocols. The value "1" means that that the fieldbus is active.

The following distribution of the bits applies for subindices 1 and 2:

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
													E-IP	MTCP	MRTU

E-IP

EtherNet/IP™ protocol

2290h PDI Control

Function

With this object, you can activate the *Plug&Drive interface*. You can find additional information in document *Function description Plug&Drive interface*.

Object description

Index	2290 _h
Object name	PDI Control
Object Code	VARIABLE
Data type	UNSIGNED8
Savable	yes, category: application
Access	read / write

PDO mapping	no
Allowed values	
Preset value	01 _h
Firmware version	FIR-v1748-B531667
Change history	Firmware version FIR-v1748-B538662: "Access" table entry for subindex 00 changed from "read only" to "read/write".

Description

To activate the *Plug&Drive interface*, set bit 0 to "1".

2291h PDI Input

Function

If you use the *Plug&Drive interface*, you can use this object to select and start the operating mode and set the corresponding target values (target position, speed, etc.). You can find additional information in document *Function description Plug&Drive interface*.

2300h NanoJ Control

Function

Controls the execution of a *NanoJ program*.

Object description

Index	2300 _h
Object name	NanoJ Control
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write

PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1436: "Object Name" entry changed from "VMM Control" to "NanoJ Control".

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
													Ayield		ON

ON

Switches the *NanoJ program* on (value = "1") or off (value = "0").

With a rising edge in bit 0, the program is first reloaded and the variable range reset.

NOTE

Startup of the *NanoJ program* can take up to 200 ms.

When switching on, a check is performed to determine whether a *NanoJ program* is present. If present, "1" is entered in 2300 and the *NanoJ program* is started.

Ayield (AutoYield)

If this feature is activated (bit set to "1"), the *NanoJ program* is no longer stopped if it runs longer than it is allowed to. The *NanoJ program* is, thus, no longer real-time capable and no longer runs every 1 ms (see [Available computing time](#)).

NOTE

Do not use the [Debug output](#) if *Auto Yield* mode is activated.

2301h NanoJ Status

Function

Indicates the operating state of the user program.

Object description

Index	2301 _h
Object name	NanoJ Status
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no

Access	read only
PDO mapping	TX-PDO

Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1436: "Object Name" entry changed from "VMM Status" to "NanoJ Status".

Description

RUN

Value = "0": Program is stopped, value = "1": NanoJ program is running.

RES

Reserved.

ERR

Program was ended with an error. Cause of the error can be read from object 2302_h.

2302h NanoJ Error Code

Function

Indicates which error occurred during the execution of the user program.

Object description

Index	2302 _h
Object name	NanoJ Error Code
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1436: "Object Name" entry changed from "VMM Error Code" to "NanoJ Error Code".

Description

Error codes during program execution:

Number	Description
0001 _h	Firmware does not support the used function (e.g., <code>sin</code> , <code>cosin</code> , etc.)
0005 _h	Time Out: Code executed too long without <code>yield()</code> or <code>sleep()</code>
0007 _h	Too many variables on the stack
0100 _h	Invalid NanoJ program file
0101 _h	Invalid NanoJ version of the program file
0102 _h	CRC error in the NanoJ program file

Error when accessing an object:

Number	Description
1xxxxyy _h	Invalid mapping in the NanoJ program file: The value in "xxxx" specifies the index, the value in "yy" specifies the subindex of the object that should – but cannot – be mapped.
2000000 _h	Invalid mapping in the NanoJ program file: too many variables of type <code>input</code> were declared (see 2310h NanoJ Input Data Selection)
3000000 _h	Invalid mapping in the NanoJ program file: too many variables of type <code>output</code> were declared (see 2320h NanoJ Output Data Selection)
4000000 _h	Invalid mapping in the NanoJ program file: too many variables of type <code>inout</code> were declared (see 2330h NanoJ In/output Data Selection)
1000 _h	Access of a nonexistent object in the object dictionary
1001 _h	Write access of a write-protected entry in the OD
1002 _h	An attempt was made to write a value that is too low or too high to an object.
1003 _h	An attempt was made to read out an object that permits only write access.
1FFF _h	Unauthorized access of an object

230Fh Uptime Seconds

Function

This object contains the operating time in seconds since the last time the controller was started.

NOTE

This object is not stored; counting begins with "0" again after switching on.

Object description

Subindex	01 _h - 40 _h
Name	Value #1 - #64
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	00 _h

Description

Here, the NanoJ program stores the debug output that was called up with the `VmmDebugOutputString()` and `VmmDebugOutputInt()`.

2800h Bootloader And Reboot Settings

Function

With this object, a reboot of the firmware can be triggered and the short circuiting of the motor windings in boot loader mode switched off and on.

Object description

Index	2800 _h
Object name	Bootloader And Reboot Settings
Object Code	ARRAY
Data type	UNSIGNED32

Savable	yes, category: application
Access	read only
PDO mapping	no
Allowed values	
Preset value

Subindex	03 _h
Name	Bootloader HW Config
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h

Description

The subindices have the following function:

- 01_h: If the value "746F6F62_h" is entered here, the firmware is rebooted.
- 02_h: Time in milliseconds: delays the reboot of the firmware by the respective time.
- 03_h: Bit 0 can be used to switch short circuiting of the motor windings in boot loader mode off and on:
 - Bit 0 = 1: Short circuiting of the motor windings in boot loader mode is switched off.
 - Bit 0 = 0: Short circuiting of the motor windings in boot loader mode is switched on.

3202h Motor Drive Submode Select

Function

Controls the controller mode, such as the changeover between *closed loop / open loop* and whether Velocity Mode is simulated via the S-controller or functions with a real V-controller in *closed loop*.

Object description

Index	3202 _h
Object name	Motor Drive Submode Select
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: drive
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	<p>Firmware version FIR-v1540: "Savable" entry changed from "yes category: application" to "yes, category: travel".</p> <p>Firmware version FIR-v1540: "Savable" entry changed from "yes category: travel" to "yes, category: movement".</p>

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
								Slow	BLDC	Torque	AutoAI	CurRed	Brake	VoS	CL/OL

CL/OL

Changeover between *open loop* and *closed loop* (see chapter [Control modes](#))

- Value = "0": *open loop*
- Value = "1": *closed loop*

Toggleing is not possible in the *Operation enabled* state.

VoS

Value = "1": Simulate V-controller with an S-ramp: simulate the speed modes through continuous position changes

Brake

Value = "1": Switch on automatic brake control.

CurRed (Current Reduction)

Value = "1": Current reduction activated in *open loop*

AutoAI (*auto alignment*)

For the case that operation in *closed loop* is required (bit 0 in 3202_h is set).

Value = "1": The *auto alignment* process is activated; immediately after switching on, an alignment is determined in *open loop* and a switch is immediately made to *closed loop* mode without the encoder index having been seen.

The rotor is moved slightly during this process.

Value = "0": No *auto alignment*, the motor operates in *open loop* until the encoder index is seen (maximum one revolution of the motor shaft).

If the incremental encoder used for commutation does not have an index (bit 0 in 33A0_h is "0"), an *auto alignment* is always determined.

Torque

only active in operating modes Profile Torque and Cyclic Synchronous Torque

Value = "1": M-controller is active, otherwise a V-controller is superimposed: no V-controller is used in the torque modes for speed limiting, thus object 6080_h is ignored; 3210_h:3 and 3210_h:4 have no effect on the control.

BLDC

Value = "1": Motor type "BLDC" (brushless DC motor)

Slow (*slow speed*)

Value = "1": The slow speed mode is activated (*closed loop* must already be activated)

3203h Feedback Selection

Function

In this object, the sources of the presets are defined for the commutation and the velocity and position control.

A value change in the *Operation enabled* state shows no immediate effect. Value changes in objects are buffered and read out upon changing to the *Operation enabled* state.

Object description

Index	3203 _h
Object name	Feedback Selection
Object Code	ARRAY
Data type	UNSIGNED8

Preset value	00 _h

Subindex	03 _h
Name	3rd Feedback Interface
Data type	UNSIGNED8
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00 _h

Description

The subindices have the following function:

- 00_h: Value="1" to "n", where "n" is the number of existing feedbacks.
- n_h:
Subindex n contains a bit mask for the respective feedback n. The bits have the following meaning here:
- Bit 0: If the bit is set to "1", this sensor is used for position feedback.

- Bit 1: If the bit is set to "1", this sensor is used for velocity feedback.
- Bit 2: If the bit is set to "1", this sensor is used for commutation feedback in [Closed Loop](#).

Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter [Configuring the sensors](#).

Which sensor the controller takes into account for the individual controllers (commutation, velocity, position) is implicitly specified by the order of the sensors.

The search always begins with sensor 2 and continues in ascending order until all existing sensors have been queried. If a sensor is found whose feedback is set, it is assigned to the corresponding controller and the search ended.

NOTE

If bit 0 in 3202_h is set to "0", *closed loop* is deactivated; bit 2 (commutation) then has no meaning. Bit 1 for the velocity and bit 0 for the position in the respective subindices are still used for the display of the actual position and speed values.

3204h Feedback Mapping

Function

This object contains information on the existing feedbacks.

Object description

Index	3204 _h

Description

The subindices have the following function:

- 00_h: Value="1" to "n", where "n" is the number of existing feedbacks.
- n_h:
 Subindex n refers to the index of the respective object for the configuration of the corresponding feedback.
 Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter [Configuring the sensors](#).

320Dh Torque Of Inertia Factor

Function

This factor is used for calculating the acceleration feed forward (see [320E_h:08_h](#)). Default is 0 (feed forward inactive).

Acceleration feed forward applies during deceleration as well.

Object description

Index	320D _h

Subindex	02 _h
Name	Acceleration
Data type	UNSIGNED32
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00000000 _h

Description

The value is dependent on the inertia of the load. To determine the factor:

1. Activate *closed loop* and select the *profile torque* mode.
2. Set a target for the torque and enter the corresponding current value (mA) in 320D_h:01_h.
3. Record (e. g., in *Plug & Drive Studio*) the current speed (object 606C_h). Calculate the acceleration in the set *user-defined units* for the speed range, where this is constant. Enter the value in 320D_h:02_h.

Using the speed curve in the following figure as an example:
 $(90-50)/(1200-980)=182 \text{ rpm/s}$.

320Eh Closed Loop Controller Parameter

Function

Contains the control parameters for *closed loop*.

NOTE

For firmware versions from FIR-v19xx upwards, the new schema for the Controller structure applies.

The old control parameters (object 3210_h) are activated in the factory settings for compatibility reasons. For new applications, Nanotec recommends using the new control parameters.

To use the new parameters, you must set 3210_h:07_h (for *closed loop*) or 3210_h:09_h (for *open loop*) to "0". The old values are converted and entered in the new object 320E_h or 320F_h. You must save both objects (see Saving objects).

Description

- Subindex 00_h: Number of entries
- Subindex 01_h: Gain factor (proportional component) of the position controller in tenths of a percent
- Subindex 02_h: Reset time (integral component) of the position controller in microseconds
- Subindex 03_h: Speed feed forward in tenths of a percent. Default is 1000 and, thus, a factor of 1.
- Subindex 04_h: Maximum control deviation of the position controller in user-defined units
- Subindex 05_h: Maximum permissible speed of the motor in user-defined units. See 6080_h.
- Subindex 06_h: Gain factor (proportional component) of the velocity controller in tenths of a percent
- Subindex 07_h: Reset time (integral component) of the velocity controller in microseconds
- Subindex 08_h: Acceleration feed forward in tenths of a percent of the value of 320D_h
- Subindex 09_h: Maximum control deviation of the velocity controller in user-defined units
- Subindex 0A_h: Maximum current in tenths of a percent of the set rated current, see object 6073_h
- Subindex 0B_h: Gain factor (proportional component) of the current controller in tenths of a percent
- Subindex 0C_h: Reset time (integral component) of the current controller in microseconds
- Subindex 0D_h: Voltage feed forward in tenths of a percent of the voltage that is needed to produce the rated current
- Subindex 0E_h: Maximum control deviation of the current controller in tenths of a percent
- Subindex 0F_h: Maximum permissible PWM voltage (duty cycle). Values ≤ 1000 are interpreted as per mil values (of the available voltage). Values > 1000 as millivolt.

Also dependent on this value is whether the *overmodulation* of the voltage vector is used. If *overmodulation* is used, a higher torque can be achieved. The resulting voltage is no longer sinusoidal, which can result in harmonics and higher losses.

Value in mV	Overmodulation
1001...U _{o_low}	None; the voltage vector describes a circle.
U _{o_low} ...U _{o_high}	The voltage vector describes a circle that is increasingly flattened on four/six sides in proportion to the set value.
≥U _{o_high}	Full; the voltage vector describes a square or a hexagon.

U_{o_low}

The lowest voltage above which overmodulation occurs. Is calculated as follows:

$$\text{Operating voltage} \cdot 0.9425$$

U_{o_high}

The maximum overmodulation occurs above this voltage. Is calculated as follows:

$$\text{With two-phase stepper motors: operating voltage} \cdot 1.063$$

$$\text{With three-phase BLDC motors: operating voltage} \cdot 0.99$$

320Fh Open Loop Controller Parameter

Function

Contains the control parameters for open loop.

NOTE

For firmware versions from FIR-v19xx upwards, the new schema for the Controller structure applies.

The old control parameters (object 3210_h) are activated in the factory settings for compatibility reasons. For new applications, Nanotec recommends using the new control parameters.

To use the new parameters, you must set 3210_h:07_h (for *closed loop*) or 3210_h:09_h (for *open loop*) to "0". The old values are converted and entered in the new object 320E_h or 320F_h. You must save both objects (see Saving objects).

- Subindex 0C_h: (Closed loop) Acceleration feed forward. Default is 0 (feed forward inactive). It applies during deceleration as well.

3212h Motor Drive Flags

Function

This object is used to specify whether or not auto_setup is to adapt the controller parameters. The direction of the rotating field can also be changed.

NOTE

Changes in subindex 02_h do not take effect until after the controller is restarted. Afterwards, Auto setup must again be performed.

Description

Valid values for subindex 02_h:

- Value = "0": Use default values of the firmware
- Value = "1": Force non-inversion of the rotating field (mathematically positive)
- Value = "-1": Force inversion of the rotating field (mathematically negative)

Valid values for subindex 03_h:

- Value = "0": Auto setup detects the motor type (stepper motor or BLDC motor) and uses the corresponding pre-configured parameter set.
- Value = "1": Perform auto setup with the values for the controller that were entered in object 3210_h or 320E_h before the auto setup; the values in 3210_h or 320E_h are not changed.

3220h Analog Inputs

Function

Displays the instantaneous values of the analog inputs in *ADC digits*.

With object 3221_h, the respective analog input can be configured as current or voltage input.

Description

The subindices have the following function:

- **3240_h:01_h** (Special Function Enable): This bit allows special functions of an input to be switched off (value "0") or on (value "1"). If input 1 is not used as, e.g., a negative limit switch, the special function must be switched off to prevent an erroneous response to the signal generator. The object has no effect on bits 16 to 31.

The firmware evaluates the following bits:

- Bit 0: Negative limit switch
- Bit 1: Positive limit switch
- Bit 2: Home switch
- Bit 3: Interlock

If, for example, two limit switches and one home switch are used, bits 0–2 in 3240_h:01_h must be set to "1".

- **3240_h:02_h** (Function Inverted): This subindex switches from normally open logic (a logical high level at the input yields the value "1" in object 60FD_h) to normally closed logic (the logical high level at the input yields the value "0").

This applies for the special functions (except for the clock and direction inputs) and for the normal inputs. If the bit has the value "0", normally open logic applies; for the value "1", normally closed logic applies. Bit 0 changes the logic of input 1, bit 1 changes the logic of input 2, etc.

- **3240_h:03_h** (Force Enable): This subindex switches on the software simulation of input values if the corresponding bit is set to "1".
In this case, the actual values are no longer used in object 3240_h:04_h, but rather the set values for the respective input. Bit 0 corresponds to input 1 here, bit 1 to input 2, etc.
- **3240_h:04_h** (Force Value): This bit specifies the value that is to be read as the input value if the same bit was set in object 3240_h:03_h.
- **3240_h:05_h** (Raw Value): This object contains the unmodified input value.
- **3240_h:07_h** (Differential Select): With the inputs, this subindex switches between "single-ended input" (value "0" in the subindex) and "differential input" (value "1" in the subindex) if the input supports this function.
- **3240_h:08_h** (Routing Enable): The value "1" in this subindex activates Input Routing.

3242h Digital Input Routing

Function

This object determines the source of the input routing that ends in 60FD_h.

Object description

Index	3242 _h

Allowed values	
Preset value	00 _h

3243h Digital Input Homing Capture

Function

With this object, the current position can be noted automatically if a level change occurs at the digital input that is used for the home switch.

NOTE

Do not use this function in combination with a homing operation. The homing operation cannot otherwise be successfully completed.

Description

- Subindex 01_h: This is used to select the type of level change:
 - Deactivate function: Value "0"
 - With rising edge: Value "1"
 - With falling edge: Value "2"
 - Both edges: Value "3"
- Subindex 02_h: Specifies the number of the noted level changes since the time the function was started; is reset to 0 if subindex 01_h is set to 1,2 or 3

- Subindex 03_h: Encoder position of the level change (in absolute user units from 6064_h)
- Subindex 04_h: Encoder position of the level change

3250h Digital Outputs Control

Function

This object can be used to control the digital outputs as described in chapter " [Digital inputs and outputs](#) " .

The following applies for all subindices:

- Bits 0 to 15 control the special functions.
- Bits 16 to 31 control the level of the outputs.

Description

The subindices have the following function:

- 01_h: No function.
- 02_h: This subindex is used to invert the logic (from normally closed logic to normally open logic).
- 03_h: This subindex is used to force the output value if the bit has the value "1". The level of the output is defined in subindex 4_h.
- 04_h: This subindex is used to define the level to be applied to the output. The value "0" returns a logical low level at the digital output; the value "1", on the other hand, returns a logical high level.
- 05_h: The bit combination applied to the outputs is stored in this subindex.
- 08_h: If the subindex is set to "1", *Output Routing* is activated.

NOTE

Entries 3250_h:01_h to 3250:04_h then have **no** function until *Output Routing* is again switched off.

- 09_h: For switching control of the Power LED on/off. If bit 0 is set to "1", the green LED is activated (flashes in normal operation). If bit 1 is set to "1", the red LED is activated (flashes in case of an error). If the bit is set to "0", the respective LED remains off.

3252h Digital Output Routing

Function

This object assigns a signal source to an output; this signal source can be controlled with 60FE_h. You can find details in chapter *Output Routing*.

Object description

3320h Read Analogue Input

Function

This object displays the instantaneous values of the analog inputs in user-defined units.

Object description

Index	3320 _h
Object name	Read Analogue Input
Object Code	ARRAY
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	no
Allowed values	
Preset value	
Firmware version	FIR-v1426
Change history	

Value description

Subindex	00 _h
Name	Number Of Analogue Inputs
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	01 _h

Subindex	01 _h
Name	Analogue Input 1
Data type	INTEGER32
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h

Description

The user-defined units are made up of offset (3321_h) and scaling value (3322_h/ 3323_h). If both are still set to the default values, the value in 3320_h is specified in the *ADC Digits* unit.

Formula for converting from digits to the respective unit:

- Voltage input: $x \text{ digits} * 10 \text{ V} / 1023 \text{ digits}$
- Current input (if configurable): $x \text{ digits} * 20 \text{ mA} / 1023 \text{ digits}$

The following applies for the sub-entries:

- Subindex 00_h: Number of analog inputs
- Subindex 01_h: Analog value 1
- Subindex 02_h: Analog value 2 (if present)

3321h Analogue Input Offset

Function

Offset that is added to the read analog value (3220_h) before scaling (multiplier from object 3322 and divisor from object 3323_h).

Object description

Index	3321 _h
Object name	Analogue Input Offset

Subindex	02 _h
Name	Alignment
Data type	UNSIGNED16
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h

Description

The subindices have the following function:

- 01_h (Configuration): The following bits have a meaning:
 - Bit 0: Value = "0": The encoder does not have an index. Value = "1": Encoder index exists and is to be used.
- 02_h (Alignment): This value specifies the offset between the index of the encoder and the rotor's magnets. The exact determination is possible via [auto setup](#). The presence of this value is necessary for *closed loop* mode with encoder.

3502h MODBUS Rx PDO Mapping

Function

The objects for RX mapping can be written in this object.

NOTE

To be able to change the mapping, you must first deactivate it by setting subindex 0_h to "0".

After writing the objects to the respective subindices, enter the number of mapped objects in subindex 0_h.

3700h Deviation Error Option Code

Function

The object contains the action that is to be executed if a following or slippage error is triggered.

Object description

Index	3700 _h
Object name	Deviation Error Option Code
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FFFF _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1738-B501312: "Object Name" entry changed from "Following Error Option Code" to "Deviation Error Option Code".

Description

Value	Description
-32768 ... -2	Reserved
-1	no reaction

Value	Description
0	Switch off driver without deceleration ramp; drive function blocked – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (6085 _h)
3 ... 32767	reserved

3701h Limit Switch Error Option Code

Function

If a limit switch is passed over, bit 7 (*Warning*) is set in 6041_h (*statusword*) and the action that is stored in this object executed.

Object description

Index	3701 _h
Object name	Limit Switch Error Option Code
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FFFF _h
Firmware version	FIR-v1748-B538662
Change history	

Description

Value in object 3701 _h	Description
-1	No reaction (e. g., to execute a homing operation)
1	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Switch on disabled</i>
2	Braking with <i>quick stop ramp</i> and subsequent state change to <i>Switch on disabled</i>
5	Braking with <i>slow down ramp</i> (deceleration ramp depending on operating mode) and subsequent state change to <i>Quick stop active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.
6	Braking with <i>quick stop ramp</i> and subsequent state change to <i>Quick Stop Active</i> ; control does not switch off and the motor remains energized. You can switch back to the <i>Operation enabled</i> state.

NOTE

The quick-stop bit (bit 2) in 6040_h is not automatically set to "0" when the state changes to *Quick stop active*.

► If you want to change the *state machine* back to the *Operation enabled* state, you must set the bit to "0" and then to "1" again.

4012h HW Information

Function

This object contains information about the hardware.

Object description

Index	4012 _h

Subindex	03 _h
Name	UB Power Hysteresis [mV]
Data type	UNSIGNED32
Access	read / write
PDO mapping	no

Allowed values	
Preset value	000001F4 _h

Description

The subindices have the following function:

- 01_h:
 - Bit 0: Switches the ballast on (value = "1") or off (value = "0")
- 02_h: Response threshold (switch on/off) of the ballast circuit
- 03_h: Hysteresis for the response threshold (switch on/off)

4040h Drive Serial Number

Function

This object contains the serial number of the controller.

Object description

Index	4040 _h
Object name	Drive Serial Number
Object Code	VARIABLE
Data type	VISIBLE_STRING
Savable	no
Access	read only
PDO mapping	no
Allowed values	
Preset value	0
Firmware version	FIR-v1450
Change history	

4041h Device Id

Function

This object contains the ID of the device.

Object description

Index	4041 _h
Object name	Device Id
Object Code	VARIABLE
Data type	OCTET_STRING
Savable	no
Access	read only
PDO mapping	no

Subindex	03 _h
Name	Bootloader Hw-group
Data type	UNSIGNED32
Access	read only
PDO mapping	no
Allowed values	
Preset value	00000000 _h

Description

The subindices have the following functions:

- 01_h: Version of the boot loader. The 4 most significant bytes contain the main version number; the 4 least significant bytes contain the minor version number. Example for version 4.2: 00040002_h
- 02_h: Fieldbuses supported by the boot loader. The bits have the same function as the bits of object [2101h Fieldbus Module Availability](#).

603Fh Error Code

Function

This object returns the error code of the last error that occurred.

It corresponds to the lower 16 bits of object [1003_h](#). For the description of the error codes, refer to object [1003_h](#).

Object description

Index	603F _h
Object name	Error Code
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

Description

For the meaning of the error, see object [1003_h](#) (Pre-defined Error Field).

6040h Controlword

Function

This object controls the [CiA 402 Power State Machine](#).

Object description

Index	6040 _h
Object name	Controlword
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

Description

Parts of the object are, with respect to function, dependent on the currently selected mode.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
						OMS	HALT	FR		OMS [3]		EO	QS	EV	SO

SO (Switched On)

Value = "1": Switches to the "Switched on" state

EV (Enable Voltage)

Value = "1": Switches to the "Enable voltage" state

QS (Quick Stop)

Value = "0": Switches to the "Quick stop" state

EO (Enable Operation)

Value = "1": Switches to the "Enable operation" state

OMS (Operation Mode Specific)

Meaning is dependent on the selected operating mode

FR (Fault Reset)

Resets an error or a warning (if possible)

HALT

Value = "1": Triggers a halt; valid in the following modes:

- Profile Position
- Velocity
- Profile Velocity
- Profile Torque
- Interpolated Position Mode

6041h Statusword

Function

This object returns information about the status of the CiA 402 Power State Machine.

Object description

Index	6041 _h
Object name	Statusword
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

Description

Parts of the object are, with respect to function, dependent on the currently selected mode. Refer to the corresponding section in chapter Operating modes.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CLA		OMS [2]	ILA	TARG	REM	SYNC	WARN	SOD	QS	VE	FAULT	OE	SO	RTSO	

RTSO (Ready To Switch On)

Value = "1": Controller is in the "Ready to switch on" state

SO (Switched On)

Value = "1": Controller is in the "Switched on" state

OE (Operation Enabled)

Value = "1": Controller is in the "Operation enabled" state

FAULT

Error occurred (see 1003_h)

VE (Voltage Enabled)

Voltage applied

QS (Quick Stop)

Value = "0": Controller is in the "Quick stop" state

SOD (Switched On Disabled)

Value = "1": Controller is in the "Switched on disabled" state

WARN (Warning)

Value = "1": Warning

SYNC (synchronization)

Value = "1": Controller is in sync with the fieldbus; value = "0": Controller is not in sync with the fieldbus

REM (Remote)

Remote (value of the bit is always "1")

TARG

Target reached

ILA (Internal Limit Active)

Limit exceeded

OMS (Operation Mode Specific)

Meaning is dependent on the selected operating mode

CLA (Closed Loop Active)

Value = "1": The controller is in the *Operation enabled* state and the Closed Loop is activated.

Listed in the following table are the bit masks that break down the state of the controller.

Statusword (6041 _h)	State
xxxx xxxx x0xx 0000	Not ready to switch on
xxxx xxxx x1xx 0000	Switch on disabled
xxxx xxxx x01x 0001	Ready to switch on
xxxx xxxx x01x 0011	Switched on
xxxx xxxx x01x 0111	Operation enabled
xxxx xxxx x00x 0111	Quick stop active
xxxx xxxx x0xx 1111	Fault reaction active
xxxx xxxx x0xx 1000	Fault

6042h VI Target Velocity**Function**

Specifies the target speed in user-defined units for Velocity mode.

Object description

Index	6042 _h
Object name	VI Target Velocity
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00C8 _h
Firmware version	FIR-v1426

Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".
----------------	--

6043h VI Velocity Demand

Function

Speed specification in user-defined units for the controller in Velocity mode.

Object description

Index	6043 _h
Object name	VI Velocity Demand
Object Code	VARIABLE
Data type	INTEGER16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

6044h VI Velocity Actual Value

Function

Specifies the current actual speed in user-defined units in Velocity mode.

Object description

Index	6044 _h
Object name	VI Velocity Actual Value
Object Code	VARIABLE
Data type	INTEGER16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

6046h VI Velocity Min Max Amount

Function

This object can be used to set the minimum speed and maximum speed in user-defined units.

Object description

Index	6046 _h
Object name	VI Velocity Min Max Amount
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Firmware version	FIR-v1426
Change history	

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	02 _h

Subindex	01 _h
Name	MinAmount
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h

Subindex	02 _h
Name	MaxAmount
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00007530 _h

Description

Subindex 1 contains the minimum speed.

Subindex 2 contains the maximum speed.

If the value of the target speed (object 6042_h) specified here is less than the minimum speed, the minimum speed applies and bit 11 (Internal Limit Reached) in 6041_h Statusword_h is set.

A target speed greater than the maximum speed sets the speed to the maximum speed and bit 11 (Internal Limit Reached) in 6041_h Statusword_h is set.

6048h VI Velocity Acceleration

Function

Sets the acceleration ramp in Velocity Mode (see [Velocity](#)).

Object description

Index	6048 _h
Object name	VI Velocity Acceleration
Object Code	RECORD
Data type	VELOCITY_ACCELERATION_DECELERATION
Savable	yes, category: application
Firmware version	FIR-v1426
Change history	

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	02 _h

Subindex	01 _h
Name	DeltaSpeed
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	000001F4 _h

Subindex	02 _h
Name	DeltaTime
Data type	UNSIGNED16
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0001 _h

Description

The acceleration is specified as a fraction in user-defined units:

Speed change per change in time.

Subindex 01_h: Contains the change in speed.

Subindex 02_h: Contains the change in time.

6049h VI Velocity Deceleration

Function

Sets the deceleration (deceleration ramp) in Velocity Mode (see [Velocity](#)).

Object description

Index	6049 _h
Object name	VI Velocity Deceleration
Object Code	RECORD
Data type	VELOCITY_ACCELERATION_DECELERATION
Savable	yes, category: application
Firmware version	FIR-v1426

Subindex	02 _h
Name	DeltaTime
Data type	UNSIGNED16
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0001 _h

Description

The deceleration is specified as a fraction in user-defined units:

Speed change per change in time.

Subindex 01_h: Contains the change in speed.

Subindex 02_h: Contains the change in time.

604Ah VI Velocity Quick Stop

Function

This object defines the deceleration (deceleration ramp) if the Quick Stop state is initiated in velocity mode.

Object description

Index	604A _h
Object name	VI Velocity Quick Stop
Object Code	RECORD
Data type	VELOCITY_ACCELERATION_DECELERATION

Data type	UNSIGNED16
Access	read / write
PDO mapping	RX-PDO
Allowed values	

Preset value	0001 _h
--------------	-------------------

Description

The deceleration is specified as a fraction in user-defined units:

Speed change per change in time.

Subindex 01_h: Contains the change in speed.

Subindex 02_h: Contains the change in time.

604Ch VI Dimension Factor

Function

The unit for speed values is defined here for the objects associated with velocity mode.

Object description

Index	604C _h
Object name	VI Dimension Factor
Object Code	ARRAY
Data type	INTEGER32
Savable	yes, category: application
Firmware version	FIR-v1426
Change history	

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	02 _h

Subindex	01 _h
Name	VI Dimension Factor Numerator
Data type	INTEGER32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000001 _h

Subindex	02 _h
Name	VI Dimension Factor Denominator
Data type	INTEGER32

Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000001 _h

Description

Subindex 1 contains the numerator (multiplier) and subindex 2 contains the denominator (divisor) with which the internal speed values are converted to revolutions per minute. If, for example, subindex 1 is set to the value "60" and subindex 2 is set to the value "1", the speed is specified in revolutions per second (60 revolutions per 1 minute).

605Ah Quick Stop Option Code

Function

The object contains the action that is to be executed on a transition of the CiA 402 Power State Machine to the *Quick Stop active* state.

Object description

Index	605A _h
Object name	Quick Stop Option Code
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application

Change history	

Description

Value in object 605E _h	Description
-32768 ... -1	Reserved
0	Blocking of the drive function – motor can turn freely
1	Braking with <i>slow down ramp</i> (braking deceleration depending on operating mode)
2	Braking with <i>quick stop ramp</i> (6085 _h)
3 ... 32767	Reserved

6060h Modes Of Operation

Function

The desired operating mode is entered in this object.

Object description

Index	6060 _h
Object name	Modes Of Operation
Object Code	VARIABLE
Data type	INTEGER8
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

Description

Mode	Description
-2	Auto setup
-1	Clock-direction mode
0	No mode change/no mode assigned
1	Profile Position Mode
2	Velocity Mode
3	Profile Velocity Mode
4	Profile Torque Mode
5	Reserved
6	Homing Mode
7	Interpolated Position Mode
8	Cyclic Synchronous Position Mode
9	Cyclic Synchronous Velocity Mode
10	Cyclic Synchronous Torque Mode

6061h Modes Of Operation Display

Function

Indicates the current operating mode. See also [6060h Modes Of Operation](#).

Object description

Index	6061 _h
Object name	Modes Of Operation Display
Object Code	VARIABLE
Data type	INTEGER8
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00 _h
Firmware version	FIR-v1426
Change history	

6062h Position Demand Value

Function

Indicates the current demand position in [user-defined units](#).

Object description

Index	6062 _h
Object name	Position Demand Value
Object Code	VARIABLE

Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

6063h Position Actual Internal Value

Function

Contains the current actual position in encoder increments. Unlike objects 6062_h and 6064_h, this value is not set to "0" following a Homing operation. The source is determined in 3203h Feedback Selection.

NOTE

If the encoder resolution in object 608F_h = zero, the numerical values of this object are invalid.

Object description

Index	6063 _h
Object name	Position Actual Internal Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

6064h Position Actual Value

Function

Contains the current actual position in user-defined units. The source is determined in 3203h Feedback Selection.

Object description

Index	6064 _h
Object name	Position Actual Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no

Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

6065h Following Error Window

Function

Defines the maximum allowed following error in user-defined units symmetrically to the demand position.

Object description

Index	6065 _h
Object name	Following Error Window
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000100 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1504: "Savable" entry changed from "no" to "yes, category: application".

Description

If the actual position deviates so much from the demand position that the value of this object is exceeded, bit 13 in object 6041_h is set. The deviation must last longer than the time in object 6066_h.

If the value of the "Following Error Window" is set to "FFFFFFFF"_h, following error monitoring is switched off.

A reaction to the following error can be set in object 3700_h. If a reaction is defined, an error is also entered in object 1003_h.

6066h Following Error Time Out

Function

Time in milliseconds until a larger following error results in an error message.

Object description

Index	6066 _h
Object name	Following Error Time Out
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application

Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0064 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1504: "Savable" entry changed from "no" to "yes, category: application".

Description

If the actual position deviates so much from the demand position that the value of object [6065_h](#) is exceeded, bit 13 in object [6041_h](#) is set. The deviation must persist for longer than the time defined in this object.

A reaction to the following error can be set in object [3700_h](#). If a reaction is defined, an error is also entered in object [1003_h](#).

6067h Position Window

Function

Specifies a range symmetrical to the target position within which that target is considered having been met in modes [Profile Position](#) and [Interpolated Position Mode](#).

Object description

Index	6067 _h
Object name	Position Window
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000000A _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1504: "Savable" entry changed from "no" to "yes, category: application".

Description

If the current position deviates from the target position by less than the value of this object, bit 10 in object [6041_h](#) is set. The condition must be satisfied for longer than the time defined in object [6068_h](#).

If the value is set to "FFFFFFF"_h, monitoring is switched off.

6068h Position Window Time

Function

The current position must be within the "Position Window" ([6067_h](#)) for this time in milliseconds for the target position to be considered having been met in the [Profile Position](#) and [Interpolated Position Mode](#) modes.

Object description

Index	6068 _h
Object name	Position Window Time
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0064 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1504: "Savable" entry changed from "no" to "yes, category: application".

Description

If the current position deviates from the target position by less than the value of object 6067_h, bit 10 in object 6041_h is set. The condition must be satisfied for longer than the time defined in object 6068_h.

606Bh Velocity Demand Value

Function

Speed specification in user-defined units for the velocity controller.

Object description

Index	606B _h
Object name	Velocity Demand Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

Description

This object contains the output of the ramp generator, which simultaneously serves as the preset value for the velocity controller.

606Ch Velocity Actual Value

Function

Current actual speed in user-defined units.

Object description

Index	606C _h
Object name	Velocity Actual Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

606Dh Velocity Window

Function

Specifies a symmetrical range relative to the target speed within which the target is considered having been met in the Profile Velocity mode.

Object description

Index	606D _h
Object name	Velocity Window
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	001E _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1614: "Savable" entry changed from "no" to "yes, category: application".

Description

If the current speed deviates from the set speed by less than the value of this object, bit 10 in object 6041_h is set. The condition must be satisfied for longer than the time defined in object 606E_h (see also statusword in Profile Velocity Mode).

606Eh Velocity Window Time

Function

The current speed must be within the "Velocity Window" (606D_h) for this time (in milliseconds) for the target to be considered having been met.

Object description

Index	606E _h
Object name	Velocity Window Time
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1614: "Savable" entry changed from "no" to "yes, category: application".

Description

Description

If the current speed deviates from the set speed by less than the value of object 606D_h, bit 10 in object 6041_h is set. The condition must be satisfied for longer than the time defined in object 606E (see also [statusword in Profile Velocity Mode](#)).

606Fh Velocity Threshold

Function

Speed in [user-defined units](#) above which the actual speed in [Profile Velocity](#) mode is considered to be nonzero.

Object description

Index	606F _h
Object name	Velocity Threshold
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v2013-B726332
Change history	

Description

If the actual speed is greater than the value in 606E_h(Velocity Threshold) for a time of 6070_h(Velocity Threshold Time), bit 12 in 6041_h(Statusword) has the value "0". The bit otherwise remains set to "1".

6070h Velocity Threshold Time

Function

Time in milliseconds above which an actual speed greater than the value in 606F_h in Profile Velocity mode is considered to be nonzero.

Object description

Index	6070 _h
Object name	Velocity Threshold Time
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v2013-B726332
Change history	

Description

If the actual speed is greater than the value in 606F_h(Velocity Threshold) for a time of 6070_h(Velocity Threshold Time), bit 12 in 6041_h(Statusword) has the value "0". The bit otherwise remains set to "1".

6071h Target Torque

Function

This object contains the target torque for the Profile Torque and Cyclic Synchronous Torque modes in tenths of a percent of the rated torque.

Object description

Index	6071 _h
Object name	Target Torque
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object [203B_h:01](#).

The minimum of [6073_h](#) and [6072_h](#) is used as limit for the torque in [6071_h](#).

The target torque may not exceed the peak torque (proportional to the maximum motor current in [2031_h](#)).

6072h Max Torque

Function

The object describes the maximum torque for the [Profile Torque](#) and [Cyclic Synchronous Torque](#) modes in tenths of a percent of the rated torque.

Object description

Index	6072 _h
Object name	Max Torque
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0064 _h
Firmware version	FIR-v1426
Change history	

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object [203B_h:01](#).

The minimum of [6073_h](#) and [6072_h](#) is used as limit for the torque in [6071_h](#).

The target torque may not exceed the peak torque (proportional to the maximum motor current in [2031_h](#)).

6073h Max Current

Function

Contains the maximum current in tenths of a percent of the set rated current entered in [320E_h:0A_h](#). Is limited by the maximum motor current ([2031_h](#)). See also [I_{2t} Motor overload protection](#).

NOTE

For stepper motors, only the rated current is specified, not a maximum current. The value of [6073_h](#) should therefore not exceed the value 1000 (100%).

Object description

Index	6073 _h
Object name	Max Current

Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: drive
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	03E8 _h
Firmware version	FIR-v1825-B577172
Change history	

Description

The maximum current is calculated in tenths of a percent of the rated current as follows:

$$(6073_{\text{h}} * 203\text{B}_{\text{h}}:01) / 1000$$

The maximum current determines:

- the maximum current for the I2t Motor overload protection
- the rated current in *open loop* mode.

NOTE

The maximum current also affects the control behavior in *closed loop* mode (see Controller structure). If you change the maximum current, you must also proportionally adjust the value of 320E_h:09_h.

6074h Torque Demand

Function

Current torque set value requested by the ramp generator in tenths of a percent of the rated torque for the internal controller.

Object description

Index	6074 _h
Object name	Torque Demand
Object Code	VARIABLE
Data type	INTEGER16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1426
Change history	

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object 203B_h:01.

The minimum of 6073_h and 6072_h is used as limit for the torque in 6071_h.

The target torque may not exceed the peak torque (proportional to the maximum motor current in 2031_h).

6075h Motor Rated Current

Function

Contains the rated current entered in 203B_h:01_h in mA.

6077h Torque Actual Value

Function

This object indicates the current torque value in tenths of a percent of the rated torque for the internal controller.

Object description

Index	6077 _h
Object name	Torque Actual Value
Object Code	VARIABLE
Data type	INTEGER16
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1540
Change history	

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object 203B_h:01.

The minimum of 6073_h and 6072_h is used as limit for the torque in 6071_h.

The target torque may not exceed the peak torque (proportional to the maximum motor current in 2031_h).

607Ah Target Position

Function

This object specifies the target position in user-defined units for the Profile Position and Cyclic Synchronous Position modes.

Object description

Index	607A _h
Object name	Target Position
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application

Access	read / write

Data type	INTEGER32

Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h

Description

If this range is exceeded or not reached, an overflow occurs. To prevent this overflow, limit values for the target position can be set in object [607D_h](#) ("Software Position Limit").

607Ch Home Offset

Function

Specifies the difference between the zero position of the controller and the reference point of the machine in user-defined units.

Object description

Index	607C _h
Object name	Home Offset
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

607Dh Software Position Limit

Function

Defines the limit positions relative to the reference point of the application in user-defined units.

Object description

Index	607D _h
Object name	Software Position Limit
Object Code	ARRAY
Data type	INTEGER32
Savable	yes, category: application

Preset value	00000000 _h

Subindex	02 _h
Name	Max Position Limit
Data type	INTEGER32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h

Description

The absolute target position must lie within the limits set here. The Home Offset (607C_h) is not taken into account.

607Eh Polarity

Function

With this object, the direction of rotation can be reversed.

Object description

Index	607E _h
Object name	Polarity
Object Code	VARIABLE
Data type	UNSIGNED8
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	

Preset value	00 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1738-B501312: "PDO mapping" table entry for subindex 00 changed from "no" to "RX-PDO".

Description

The following generally applies for direction reversal: If a bit is set to the value "1", reversal is activated. If the value is "0", the direction of rotation is as described in the respective mode.

7	6	5	4	3	2	1	0
POS	VEL						

VEL (Velocity)

Direction of rotation reversal in the following modes:

- [Profile Velocity Mode](#)
- [Cyclic Synchronous Velocity Mode](#)

POS (Position)

Direction of rotation reversal in the following modes:

- [Profile Position Mode](#)
- [Cyclic Synchronous Position Mode](#)

TIP

You can force an inversion of the rotary field that affects all operating modes. See object [3212_h:02_h](#).

607Fh Max Profile Velocity

Function

Specifies the maximum speed in user-defined units for which the Mod i [Profile Position](#) , [Interpolated Position Mode](#) (only if [closed loop](#) is activated) and [Profile Velocity](#).

Object description

Index	607F _h
Object name	Max Profile Velocity

Description

Value = "0": = Trapezoidal ramp

Value = "3": Ramp with limited jerk

6087h Torque Slope

Function

This object contains the slope of the torque in Torque mode.

Object description

Index	6087 _h
Object name	Torque Slope
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

Description

This object is calculated as thousandths of the torque, e.g., the value "500" means "50%" of the rated torque; "1100" is equivalent to 110%. The rated torque corresponds to the rated current in object 203B_h:01.

The minimum of 6073_h and 6072_h is used as limit for the torque in 6071_h.

The target torque may not exceed the peak torque (proportional to the maximum motor current in 2031_h).

608F_h Position Encoder Resolution

Function

Contains the physical resolution (see objects 60E6_h/60EB_h) of the encoder/sensor that is used for position control (see 3203_h Feedback Selection).

Object description

Index	608F _h
Object name	Position Encoder Resolution
Object Code	ARRAY
Data type	INTEGER32

Allowed values	
Preset value	00000001 _h

Description

Position Encoder Resolution = Encoder Increments (608F_h:01_h) / Motor Revolutions (608F_h:02_h)

6090h Velocity Encoder Resolution

Function

Contains the physical resolution (see objects 60E6_h/ 60EB_h) of the encoder/sensor that is used for speed control (see 3203h Feedback Selection).

Object description

Index	6090 _h

Preset value	00000001 _h

Description

The subindices have the following functions:

- 01_h: Numerator of the factor
- 02_h: Denominator of the factor

6098h Homing Method

Function

This object defines the Homing method in Homing mode.

Object description

Index	6098 _h
Object name	Homing Method
Object Code	VARIABLE
Data type	INTEGER8
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	23 _h
Firmware version	FIR-v1426
Change history	

6099h Homing Speed

Function

Specifies the speeds for homing mode (6098_h) in user-defined units.

Object description

Index	6099 _h
Object name	Homing Speed
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Firmware version	FIR-v1426
Change history	

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8
Access	read only
PDO mapping	no

Allowed values	
Preset value	02 _h
<hr/>	
Subindex	01 _h
Name	Speed During Search For Switch
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000032 _h
<hr/>	
Subindex	02 _h
Name	Speed During Search For Zero
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000000A _h

Description

The speed for the search for the switch is specified in subindex 1.

The (lower) speed for the search for the reference position is specified in subindex 2.

NOTE

- The speed in subindex 2 is simultaneously the initial speed when starting the acceleration ramp. If this is set too high, the motor loses steps or fails to turn at all. If the setting is too high, the index marking will be overlooked, especially with high-resolution encoders. The minimum detectable width of the index pulse is 31.25 µs.
- The speed in subindex 1 must be greater than the speed in subindex 2.

609Ah Homing Acceleration

Function

Specifies the acceleration ramp for homing mode in user-defined units.

Object description

Index	609A _h
Object name	Homing Acceleration
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO

Allowed values	
Preset value	000001F4 _h
Firmware version	FIR-v1426
Change history	

Description

The ramp is only used when starting up. When the switch is reached, the motor immediately switches to the lower speed; when the end position is reached, it immediately stops.

60A2h Jerk Factor

Function

This object contains the factor that is used for converting from user-defined jerk units. See chapter [User-defined units](#).

Object description

Index	60A2 _h
Object name	Jerk Factor
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Access	read only

- Subindex 03_h (*End Acceleration Jerk*): Final jerk during acceleration
- Subindex 04_h (*End Deceleration Jerk*): Final jerk during braking

60A8h SI Unit Position

Function

This object contains the position unit. See chapter [User-defined units](#).

Object description

Index	60A8 _h
Object name	SI Unit Position
Object Code	VARIABLE

Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FF410000 _h
Firmware version	FIR-v1738-B501312
Change history	

Description

Object 60A8_h contains:

- Bits 16 to 23: The position unit (see chapter [Units](#))
- Bits 24 to 31: The exponent of a power of ten (see chapter [Units](#))

60A9h SI Unit Velocity

Function

This object contains the speed unit. See chapter [User-defined units](#).

Object description

Index	60A9 _h
Object name	SI Unit Velocity
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	yes, category: application
Access	read / write
PDO mapping	no
Allowed values	
Preset value	00B44700 _h
Firmware version	FIR-v1738-B501312
Change history	

Description

Object 60A9_h contains:

- Bits 8 to 15: The time unit (see chapter [Units](#))
- Bits 16 to 23: The position unit (see chapter [Units](#))
- Bits 24 to 31: The exponent of a power of ten (see chapter [Units](#))

60B0h Position Offset

Function

Offset for the position set value in user-defined units. Is taken into account in mode Cyclic Synchronous Position.

Object description

Index	60B0 _h
Object name	Position Offset
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1738-B505321
Change history	

60B1h Velocity Offset

Function

Offset for the speed set value in user-defined units. Is taken into account in the Cyclic Synchronous Position, Cyclic Synchronous Velocity and Clock-direction mode modes.

Object description

Index	60B1 _h
Object name	Velocity Offset
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1738-B505321
Change history	

60B2h Torque Offset

Function

Offset for the torque set value in tenths of a percent. Is taken into account in the Cyclic Synchronous Position, Cyclic Synchronous Velocity, Cyclic Synchronous Torque and Clock-direction mode modes.

Object description

Index	60B2 _h
Object name	Torque Offset
Object Code	VARIABLE
Data type	INTEGER16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0000 _h
Firmware version	FIR-v1738-B505321
Change history	

60C1h Interpolation Data Record

Function

This object contains the demand position in user-defined units for the interpolation algorithm for the interpolated position operating mode.

Object description

Index	60C1 _h
Object name	Interpolation Data Record
Object Code	ARRAY
Data type	INTEGER32
Savable	yes, category: application
Access	read only
PDO mapping	no
Allowed values	
Preset value	
Firmware version	FIR-v1512
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8

Access	read only
PDO mapping	no
Allowed values

Allowed values	
Preset value	01 _h

Subindex	02 _h
Name	Interpolation Time Index
Data type	INTEGER8
Access	read / write
PDO mapping	no
Allowed values	
Preset value	FD _h

Description

The subindices have the following functions:

- 01_h: Interpolation time.
- 02_h: Power of ten of the interpolation time: must have the value -3 (corresponds to the time basis in milliseconds).

The following applies here: cycle time = value of 60C2_h:01_h * 10^{value of 60C2:02} seconds.

60C4h Interpolation Data Configuration

Function

This object offers the maximum buffer size, specifies the configured buffer organization of the interpolated data and offers objects for defining the size of the record and for deleting the buffer.

It is also used to store the position of other data points.

Object description

Index	60C4 _h

Allowed values	
Preset value	04 _h

Subindex	06 _h
Name	BufferClear
Data type	UNSIGNED8
Access	write only
PDO mapping	no
Allowed values	
Preset value	00 _h

Description

The value of subindex 01_h contains the maximum possible number of interpolated records.

The value of subindex 02_h contains the current number of interpolated records.

If subindex 03_h is "00_h", this means a FIFO buffer organization; if it is "01_h", it specifies a ring buffer organization.

The value of subindex 04_h is unitless and specifies the next free buffer entry point.

The value of subindex 05_h is specified in units of "byte".

If the value "00_h" is written in subindex 06_h, it deletes the received data in the buffer, deactivates access and deletes all interpolated records.

If the value "01_h" is written in subindex 06_h, it activates access to the input buffer.

60C5h Max Acceleration

Function

This object contains the maximum permissible acceleration for the [Profile Position](#) and [Profile Velocity](#) modes.

Object description

Index	60C5 _h
Object name	Max Acceleration
Object Code	VARIABLE
Data type	UNSIGNED32

Savable	yes, category: application

Description

The subindices have the following function:

- 00_h: Value="1" to "n", where "n" is the number of existing feedbacks.
- n_h:
 Subindex n contains the number of increments of the corresponding feedback.
 Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter [Configuring the sensors](#).

The resolution of feedback "n" is calculated as follows:

Position Encoder Resolution = Encoder Increments (60E6_h:01_h) / Motor Revolutions (60EB_h:02_h)

TIP

The value "0" in a subindex means that the respective feedback is not connected and is not used. Thus, it is possible, for example, to switch off the sensorless function to save computing time

This can be helpful if a *NanoJ* program needs the computing time.

60E8h Additional Gear Ratio - Motor Shaft Revolutions

Function

In this object and in [60ED_h](#), you can set the gear ratio of each existing feedback.

Object description

Index	60E8 _h
Object name	Additional Gear Ratio - Motor Shaft Revolutions
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Access	read only
PDO mapping	RX-PDO

Change history	

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8
Access	read only
PDO mapping	RX-PDO
Allowed values	
Preset value	03 _h

Subindex	01 _h - 03 _h
Name	Additional Gear Ratio - Motor Shaft Revolutions Feedback Interface #1 - #3
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000001 _h

Description

The subindices have the following function:

- 00_h: Value = "n", where "n" is the number of existing feedbacks.
- n_h: Subindex "n" contains the number of motor revolutions for the corresponding feedback. Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter [Configuring the sensors](#).

The gear ratio of feedback "n" is calculated as follows:

Gear Ratio = Motor Shaft Revolutions (60E8_h:n_h) / Driving Shaft Revolutions (60ED_h:n_h)

60E9h Additional Feed Constant - Feed

Function

In this object and in 60EE_h, you can set a feed constant for each existing feedback.

Object description

Index	60E9 _h
Object name	Additional Feed Constant - Feed
Object Code	ARRAY
Data type	UNSIGNED32

Preset value	03 _h

Subindex	01 _h - 03 _h
Name	Additional Feed Constant - Feed Feedback Interface #1 - #3
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000001 _h

Description

The subindices have the following function:

- 00_h: Value = "n", where "n" is the number of existing feedbacks.
- n_h: Subindex "n" contains the feed in user-defined units for the corresponding feedback. Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter Configuring the sensors.

The feed constant of feedback "n" is calculated as follows:

Feed Constant = Feed (60E9_{h:n_h}) / Driving Shaft Revolutions (60EE_{h:n_h})

60EB_h Additional Position Encoder Resolution - Motor Revolutions

Function

With this object and with 60E6_h, the resolution of each existing feedback is calculated.

Object description

Index	60EB _h
Object name	Additional Position Encoder Resolution - Motor Revolutions

Name	Additional Gear Ratio - Driving Shaft Revolutions Feedback Interface #1 - #3
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000001 _h

Description

The subindices have the following function:

- 00_h: Value = "n", where "n" is the number of existing feedbacks.
- n_h: Subindex "n" contains the number of revolutions of the output shaft for the corresponding feedback. Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter [Configuring the sensors](#).

The gear ratio of feedback "n" is calculated as follows:

Gear Ratio = Motor Shaft Revolutions (60E8_h:n_h) / Driving Shaft Revolutions (60ED_h:n_h)

60EEh Additional Feed Constant - Driving Shaft Revolutions

Function

In this object and in 60E9_h, you can set a feed constant for each existing feedback.

Object description

Index	60EE _h
Object name	Additional Feed Constant - Driving Shaft Revolutions
Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Access	read only

Subindex	01 _h - 03 _h
Name	Additional Feed Constant - Driving Shaft Revolutions Feedback Interface #1 - #3
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000001 _h

Description

The subindices have the following function:

- 00_h : Value = "n", where "n" is the number of existing feedbacks.
- n_h : Subindex "n" contains the number of revolutions of the output shaft for the corresponding feedback. Subindex 01_h always corresponds to the first (and always existing) *sensorless* feedback. The order of the remaining feedbacks corresponds to the table in chapter [Configuring the sensors](#).

The feed constant of feedback "n" is calculated as follows:

$$\text{Feed Constant} = \text{Feed} (60E9_h:n_h) / \text{Driving Shaft Revolutions} (60EE_h:n_h)$$

60F2h Positioning Option Code

Function

The object describes the positioning behavior in [Profile Position](#) mode.

Object description

Index	60F2 _h
Object name	Positioning Option Code
Object Code	VARIABLE
Data type	UNSIGNED16
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	0001 _h
Firmware version	FIR-v1446
Change history	Firmware version FIR-v1614: "Savable" entry changed from "no" to "yes, category: application".

Description

Only the following bits are supported at the present time:

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
MS	RESERVED [3]			IP OPTION [4]			RADO [2]	RRO [2]	CIO [2]	REL. OPT. [2]					

REL. OPT. (Relative Option)

These bits determine the behavior with relative rotating movement in "profile position" mode if bit 6 of controlword $6040_h = "1"$ is set.

Bit 1	Bit 0	Definition
0	0	Position movements are executed relative to the previous (internal absolute) target position (each relative to 0 if there is no previous target position)
0	1	Position movements are executed relative to the preset value (or output) of the ramp generator.
1	0	Position movements are performed relative to the current position (object 6064_h).

Bit 1	Bit 0	Definition
1	1	Reserved

RRO (Request-Response Option)

These bits determine the behavior when passing controlword `6040h` bit 4 ("new setpoint") – in this case, the controller releases the bit itself. This eliminates the need to externally reset the bit to "0" afterwards. After the bit is set to the value "0" by the controller, bit 12 ("setpoint acknowledgment") is also set to the value "0" in statusword `6041h`.

NOTE

These options cause the controller to modify object controlword `6040h`.

Bit 5	Bit 4	Definition
0	0	The functionality is as described under Setting travel commands .
0	1	The controller releases the "new setpoint" bit as soon as the current targeted movement has reached its target.
1	0	The controller releases the "new setpoint" bit as soon this is possible for the controller.
1	1	Reserved

RADO (Rotary Axis Direction Option)

These bits determine the direction of rotation in "profile position" mode.

Bit 7	Bit 6	Definition
0	0	Normal positioning similar to a linear axis: If one of the "Position Range Limits" – <code>607B_h:01_h</code> and <code>02_h</code> – is reached or exceeded, the preset is automatically transferred to the other end of the limit. Only with this bit combination is a movement greater than the modulo value possible.
0	1	Positioning only in negative direction: If the target position is greater than the current position, the axis moves to the target position via the "Min Position Range Limit" from object <code>607D_h:01_h</code> .
1	0	Positioning only in positive direction: If the target position is less than the current position, the axis moves to the target position via the "Max Position Range Limit" from object <code>607D_h:01_h</code> .
1	1	Positioning with the shortest distance to the target position. If the difference between the current position and the target position in a 360° system is less than 180°, the axis moves in the positive direction.

60F4h Following Error Actual Value

Function

This object contains the current following error in [user-defined units](#).

Object description

Index	60F4 _h
Object name	Following Error Actual Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

60F8h Max Slippage

Function

Defines the maximum allowed slippage error in user-defined units symmetrically to the set speed in Profile Velocity mode.

Object description

Index	60F8 _h
Object name	Max Slippage
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000190 _h
Firmware version	FIR-v1738-B501312
Change history	

Description

If the actual speed deviates so much from the set speed that the value (absolute value) of this object is exceeded, bit 13 in object 6041_h is set. The deviation must last longer than the time in object 203F_h.

If the value of 60F8_h is set to "7FFFFFFF"_h, slippage error monitoring is switched off.

A reaction to the slippage error can be set in object 3700_h. If a reaction is defined, an error is also entered in object 1003_h.

60FAh Control Effort

Function

This object contains the correction speed (control variable) in user-defined units that is fed to the velocity controller by the position controller.

Object description

Index	60FA _h
Object name	Control Effort
Object Code	VARIABLE
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1748-B531667
Change history	

Description

The position controller calculates a correction speed (in user-defined units) from the difference between the current position and the demand position which is then passed on to the velocity controller. This correction value is dependent on the proportional component and integral component of the position controller. See also chapter [Closed Loop](#).

60FCh Position Demand Internal Value

Function

Indicates the current preset value for the position controller in increments of the sensor selected for the position (see [Controller structure](#)).

Object description

Index	60FC _h
Object name	Position Demand Internal Value
Object Code	VARIABLE
Data type	INTEGER32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1738-B501312
Change history	

60FDh Digital Inputs

Function

With this object, the digital inputs of the motor can be read.

Object description

Index	60FD _h
Object name	Digital Inputs
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
							...	IN 8	IN 7	IN 6	IN 5	IN 4	IN 3	IN 2	IN 1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
												IL	HS	PLS	NLS

NLS (Negative Limit Switch)

Negative limit switch

PLS (Positive Limit Switch)

Positive limit switch

HS (Home Switch)

Home switch

IL (Interlock)

Interlock

IN n (Input n)

Input n – the number of used bits is dependent on the given controller.

60FEh Digital Outputs

Function

With this object, the digital outputs of the motor can be written.

Object description

Index	60FE _h
Object name	Digital Outputs

Object Code	ARRAY
Data type	UNSIGNED32
Savable	yes, category: application
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

Value description

Subindex	00 _h
Name	Number Of Entries
Data type	UNSIGNED8
Access	read only
PDO mapping	no
Allowed values	
Preset value	01 _h

Subindex	01 _h
Name	Digital Outputs #1
Data type	UNSIGNED32
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h

Description

To write the outputs, the entries in object 3250_h, subindex 02_h to 05_h, must also be taken into account.

BRK (Brake)

Bit for the brake output (if the controller supports this function):

Value "1" means that the brake is activated (no current can flow between the two pins of the brake connection; the brake is closed).

OUT n (Output No n)

Bit for the respective digital output; the exact number of digital outputs is dependent on the controller.

60FFh Target Velocity

Function

In this object, the target speed for the profile velocity and cyclic synchronous velocity modes is entered in user-defined units.

Object description

Index	60FF _h
Object name	Target Velocity
Object Code	VARIABLE
Data type	INTEGER32
Savable	yes, category: application
Access	read / write
PDO mapping	RX-PDO
Allowed values	
Preset value	00000000 _h
Firmware version	FIR-v1426
Change history	Firmware version FIR-v1626: "Savable" entry changed from "no" to "yes, category: application".

6502h Supported Drive Modes

Function

The object describes the supported operating modes in object 6060_h.

Object description

Index	6502 _h
Object name	Supported Drive Modes
Object Code	VARIABLE
Data type	UNSIGNED32
Savable	no
Access	read only
PDO mapping	TX-PDO
Allowed values	
Preset value	000003EF _h
Firmware version	FIR-v1426
Change history	

Description

The set bit specifies whether the respective mode is supported. If the value of the bit is "0", the mode is not supported.

PP
Profile Position Mode

VL
Velocity Mode

PV
Profile Velocity Mode

TQ
Torque Mode

HM
Homing Mode

IP
