

Manual N5

Fieldbus: CANopen

For use with the following devices:

- N5-1-2
- N5-2-2

Valid with firmware version FIR-v1436
and hardware version W005

NANOTEC ELECTRONIC GmbH & Co. KG

Translation of original manual

2 Safety instructions and warnings

2.1 Important information

This technical manual must be carefully read before installation and commissioning of the motor controller.

Nanotec[®] reserves the right to make technical alterations and further develop hardware and software in the interests of its customers to improve the function of this product without prior notice.

This manual was created with due care. It is exclusively intended as a technical description of the product and as commissioning instructions. The warranty is exclusively for repair or replacement of defective equipment, according to our general terms and conditions; liability for subsequent damage or errors is excluded. Applicable standards and regulations must be complied with during installation of the device.

To submit criticism, proposals and suggestions for improvement, please contact the above address or send an email to: info@nanotec.com

2.2 Personnel qualifications

Work on and with this product may only be carried out by skilled workers

- who are familiar with and have understood the contents of this manual
- who have completed a training course or have the corresponding experience to be able to estimate, predict, or identify any dangers that may arise from using the motor controller
- who are familiar with all applicable standards, legal provisions, and accident-prevention regulations that have to be complied with when working on and with the product
- who are able to ensure personal safety when using the motor controller in an overall system

Operation may only be carried out when the specified cables and corresponding accessories are used. Use only original accessories and original spare parts.

2.3 Danger and warning signs

All signs listed in this documentation are printed in a standardized form. A hazardous situation is categorized according to the classes below depending on the level of hazard to the user or motor controller.

The DANGER sign indicates an immediately hazardous situation that, when the instruction is neglected, will unavoidably cause a serious or fatal accident.

The WARNING sign indicates a potentially hazardous situation that, when the instruction is neglected, may possibly cause a serious or fatal accident or damage to this device or other devices.

The CAUTION sign indicates a potentially hazardous situation that, when the instruction is neglected, may possibly cause an accident or damage to this device or other devices.

CAUTION

The CAUTION sign without the warning symbol indicates a possibly hazardous situation that, when the instruction is neglected, may **possibly** cause an accident or damage to this device or other devices.

2.4 Other information

The following additional information panels are used in this documentation:

Tip This panel indicates a possibility for simplifying work.

Note

This panel indicates possible error sources or risks of confusion.

Example

This panel contains an example.

3 About this manual

3.1 Introduction

This manual is directed toward programmers intending to program a motor controller using the motor controller from Nanotec[®].

3.2 Numerical values

Numerical values are always presented in decimal notation. If hexadecimal notation must be used, this is indicated by a subscript "h" at the end of the number.

The objects in the object directory are noted as follows with an index and subindex:
<Index>:<Subindex>

Both the index and subindex are in hexadecimal notation. Subindex 0 is in force when no subindex is noted.

Example: Subindex 5 of object 1003_h is addressed with "1003_h:05_h", subindex 0 of object 6040_h with "6040_h".

In the last section of the manual, all objects are listed in full, and the references in the running text and tables are set in bold, e.g. **6040_h**.

3.3 Bits

The individual bits of an object are always numbered beginning with 0 at the LSB. See the following figure, which uses the "UNSIGNED8" data type as an example.

3.4 Counting direction (arrows)

In drawings, the counting direction is always in the direction of the arrow. The objects 60C5_h and 60C6_h shown in the following figure are both positive.

3.5 Version notes

Version Manual	Version Firmware	Date	Changes
1.0.0	FIR-v1417	30.04.2014	Published
1.0.3	FIR-v1419	12.05.2014	Small corrections, assignment of OD entries is now correct
1.1.0	FIR-v1426	16.05.2014	The following sections were added: <ul style="list-style-type: none"> • Cyclic Synchronous Position • Cyclic Synchronous Velocity • Cyclic Synchronous Torque
1.2.0	FIR-v1426	23.07.2014	<ul style="list-style-type: none"> • Added chapter "Save Objects", added "Persistent" to the object description • The following objects has been moved <ul style="list-style-type: none"> • "Read Analog Input": from 6402_h to 3320_h • "Analogue Input Offset": from 6431_h to 3321_h • "Analogue Input Pre-scaling": from 6432_h to 3322_h
1.2.7	FIR-v1436	10.09.2014	Corrections

4 Technical data and pin configuration

4.1 Dimensioned drawings

4.2 Electrical properties

Operating voltage	12 V - 48 V DC (Low Current-Version), or 12 V - 48 V DC (High Current-Version)
Continuous current	10 A effective (Low Current-Version), or 18 A effective (High Current-Version)

Peak current	10 A effective (Low Current-Version), or 54 A effective (High Current-Version)
Commutation	Stepper motor open loop, stepper motor closed loop with encoder, BLDC sinus-commutated via hall sensor, BLDC sinus-commutated via encoder
Operating mode	<ul style="list-style-type: none"> • Profile Position • Velocity • Profile Velocity • Profile torque • Homing • Cyclic Sync Position • Cyclic Sync Velocity • Cyclic Sync Torque • Clock/direction mode • Application program (NanoJ)
Parameterization	Browser-based via Ethernet with the NanoIP interface
Field bus interfaces	CANopen
Encoder input	5 V or 24 V signal, differential or single-ended (switchable via software), max. resolution 65536 cycles per revolution (16 bit), UVW connection for hall sensor
Inputs	<ul style="list-style-type: none"> • 4 inputs 5 V/24 V (input 1 to 4) separately switchable via software, default setting is 5 V • 2 wide-range inputs 5–24 V (inputs 5 and 6); • 2 analog inputs -10 to +10 V or 0–20 mA (switchable via software)
Outputs	2 transistor outputs (open drain, 0-switching, max. 24 V/0.5 A)
Brake	1 open drain output, max. 1.5 A
	<p>Overvoltage and undervoltage: Protective circuit at voltage > 77.5 V or < 9 V (Low Current-Version) Protective circuit at voltage > 52.4 V or < 9 V (Low Current-Version) Overtemperature: protective circuit at temperature > 70° C Polarity reversal protection: in case of polarity reversal, short circuit between supply voltage and GND via PIN diode, therefore cable protection device (fuse) required in supply cable.</p>

4.3 LED signaling

4.3.1 Position

The operating LED is located on the side with the connectors at the bottom right (labeled with "L1" in the figure).

4.3.2 Normal operation

In normal operation the green operating LED flashes very briefly once per second.

4.3.3 Error

Should there be an error, an error number is indicated by the LED within one second. In the following illustration, the error is signaled with the number 3.

The meaning of the error number is printed in the following table.

Amount Flash	Error
1	General information
2	Voltage
3	Temperature
4	Overcurrent
5	Software

Note

A considerably more exact error code is stored in object **1003_h** for every error that has occurred.

4.4 Pin configuration

4.4.1 Overview

Connector	Function
X1	Ethernet
X2	Encoder
X3	Input and output
X4	Brake
X5	Motor connection
X6	Supply voltage
X7	External logic supply, input voltage +24 V DC Supply voltage for encoder, input voltage +24 V DC
X8	CANopen IN
X9	CANopen OUT
S1	Hex coding switch for node ID, 16's place (e.g. 0xF 0)
S2	Hex coding switch for node ID, 1's place (e.g. 0x0F)
S3	PIN1 120 ohm terminating resistance (switch at ON) PIN2 Reserved
L1	Operating LED

4.4.2 Ethernet (connector X1)

Pin 1 is marked with an asterisk "*".

4.4.3 Encoder input (connector X2)

Note

Two types of encoder are supported:

1. Encoder with a supply voltage of 5 V. In this case nothing needs to be connected to connector X7, the object **2059_h** must be set to the value "0".
2. Encoder with a supply voltage of 24 V. In this case a voltage of 24 V DC needs to get connected to the connector X7 (see **Encoder voltage supply (connector X7)**), the object **2059_h** must be set to the value "1".

Pin 1 and Pin 2 are marked in the diagram.

PIN	Function	Remark
1	GND	
2	Vcc	+5 V DC (standard) or +24 V DC, output voltage switchable via software with object 2059_h .
3	A	
4	B	
5	A\	
6	B\	
7	I	
8	I\	
9	Hall 1	
10	Hall 2	
11	Hall 3	
12	Shielding	Shielding

4.4.4 Digital inputs and outputs (connector X3)

Pin 1 is marked with an asterisk "*".

PIN	Function	Remark
1	GND	
2	Input 1	Digital input 5 V / 24 V switchable
3	Input 2	Digital input 5 V / 24 V switchable
4	Input 3	Digital input 5 V / 24 V switchable, directional input in clock/direction mode
5	Input 4	Digital input 5 V / 24 V switchable, clock input in clock/direction mode
6	Input 5	Digital input 5 V / 24 V switchable
7	Input 6	Digital input 5 V / 24 V switchable
8	Analog input 1	-10 V...+10 V or 0...20 mA
9	Analog input 2	-10 V...+10 V or 0...20 mA

PIN	Function	Remark
10	Output 1	Digital output, open drain, max. 24 V/0.5 A
11	Output 2	Digital output, open drain, max. 24 V/0.5 A
12	Shielding	Shielding

4.4.5 Brake output (connector X4)

Pin 1 is marked with an asterisk "*".

PIN	Function	Remark
1	Brake +	Internally connected with +UB
2	Brake -	PWM-controlled open drain output, max. 1.5 A

4.4.6 Motor connection (connector X5)

Pin 1 is marked with an asterisk "*".

PIN	Function	Function	Remark
	Stepper	BLDC	
1	Shielding	Shielding	Shielding
2	A	U	
3	A\	V	
4	B	W	
5	B\	n.c.	
6	Shielding	Shielding	Shielding

4.4.7 Motor controller voltage supply (connector X6)

Safety instruction

⚠ CAUTION

Danger of electrical overvoltage!

- An operating voltage that is higher than the values specified above will destroy the output stage. Mixing up the connections can destroy the output stage.
- Never connect or disconnect lines when live!
- The supply voltage must be selected so that it never exceeds the admissible operating voltage of the motor. Specifically, interference from other consumers or interference caused by the voltages induced by the motor must be taken into consideration here, and a voltage may need to be selected that offers sufficient safety reserves.

Voltage source

The operating or supply voltage is delivered by a battery (low voltage 12 V – 24 V), by a transformer with rectification and filtering, or better yet, by a switch-mode power supply.

Interference suppression and protection measures are required when a DC power supply line with a length of >30 m is used or the motor is used on a DC bus. An EMI filter must be added to the DC supply cable as close to the motor controller/motor as possible.

Long data or supply lines are to be routed through ferrites.

Connections

Pin 1 is marked with an asterisk "*".

PIN	Function	Remark
1	Shielding	Shielding
2	+VB	12-70 V DC (Low Current-Version) 12-48 V DC (High Current-Version)
3	GND	

4.4.8 Encoder voltage supply (connector X7)

CAUTION

This supply voltage is necessary only if an encoder with a supply voltage of 24 V is used. Furthermore the object **2059_n** has to get set to the value "1".

CAUTION

Nothing has to be connected in case of a 5 V encoder and the object 2059_n needs to get set to the value "0".

Pin 1 is marked with an asterisk "**".

PIN	Function	Remark
1	+VB logic/ encoder	+24 V DC, supply voltage for logic and encoder
2	GND	

4.4.9 CANopen Bus IN (connector X8)

Pin 1 is marked with an asterisk "**".

PIN	Function	Remark
1	CAN_H	
2	CAN_L	
3	CAN_GND	Connected with PIN 7 inside
4	n.c.	
5	n.c.	
6	CAN_SHLD	
7	GND	Connected with PIN 3 inside
8	+VB Logic	+24 V DC

4.4.10 CANopen Bus OUT (connector X9)

Pin 1 is marked with an asterisk "**".

PIN	Function	Remark
1	CAN_H	
2	CAN_L	
3	CAN_GND	Connected with PIN 6 and PIN 7 inside
4	n.c.	
5	n.c.	
6	CAN_SHLD	Connected with PIN 3 and PIN 7 inside
7	GND	Connected with PIN 3 and PIN 6 inside
8	+VB Logic	+24 V DC

5 Configuration

5.1 General information

The following options exist for configuring the motor controller:

NanoJ program

This program can be programmed with NanoJ Easy, compiled and then written to the motor controller via Ethernet. Read the sections and "**NanoJ program**"

CANopen NodeID and the terminating resistor

This motor controller is fitted with the CANopen field bus that can be configured with an adjuster wheel on the rear. A DIP-switch for terminating is fitted next to it. Read the "**CANopen**" section for details.

Ethernet

This motor controller is equipped with an Ethernet interface and can be configured on the NanoIP device homepage. Read the "**Ethernet interface**" section for details.

5.2 NanoJ program

A NanoJ program may be executed on the motor controller. Carry out the following steps to load and launch a program on the motor controller:

1. Write and compile your program as described in the "**Programming with NanoJ**" section.
2. Connect the voltage supply to connector X6 (see the "**Motor controller voltage supply (connector X6)**" section) and switch on the voltage supply.
3. Connect the motor controller to your PC via an Ethernet cable.
4. Open the NanoIP web interface with a web browser and copy the file onto the motor controller (details in the "**Ethernet interface**" section.).
5. On the NanoIP web interface, you can now change to the "NanoJ" tab, select the program and start it.

5.3 CANopen

5.3.1 Rotary switch

The motor controller has two integrated rotary switches S1 and S2. It can be used to set the source for the CANopen NodeID and the baud rate.

The following applies: S1 is the higher-value byte, while S2 is the lower value byte.

Example

- S1 = 0_h, S2 = F_h, this results in the figure 0F_h = 16_d
- S1 = A_h, S2 = 1_h, this results in the figure A1_h = 161_d

The NodeID can either be applied as a value from the adjuster wheel or read from object **2009_h**.

The baud rate is either fixed at 1 MBaud or is read out from object **2005_h**.

Note

- If the rotary switch is permanently set to the value "1", the NodeID is "1" and the baud rate is permanently set to 1 MHz. Should there be problems with the configuration, the value "1" always establishes communication with the motor controller and any errors can be undone.
- The changes to the objects **2005_h** and **2009_h** must always be saved ; this is done by writing the value 65766173_h into object **1010_h:2_h**.
- The changes are adopted after
 - After the voltage supply is briefly disconnected
 - Or the CANopen message "RESET COMM" (NMT) is sent to the motor controller

5.3.2 NodeID

The following table shows a summary of the options for the rotary switch..

Number of rotary switches		NodeID
hex	dec	
0	0	Object 2009_h
1-7F	1-127	Rotary switch number
80	128	Object 2009_h
81-FF	129-255	(Rotary switch number)-128

5.3.3 Baud rate

Number of rotary switches		Baud rate
hex	dec	
0	0	1 MBaud fixed
1-7F	1-127	1 MBaud fixed
80	128	Object 2005_h
81-FF	129-255	Object 2005_h

The value of **2005_h** can be taken from the following table.

Value		Baud rate
dec	hex	in kBd
129	81	10
130	82	20
131	83	50
132	84	125
133	85	250
134	86	500
135	87	1000
136	88	1000

5.3.4 Terminating resistor

The motor controller contains a switch for the terminating resistance (S3, Pin 1 is marked with a "*" in the figure, Pin 2 is not used). If the switch position is at "ON", the line is terminated with 120 Ohm.

5.4 Ethernet interface

5.4.1 Overview

Notes

CAUTION

Accesses onto the web server of the motor controller have **no** guaranteed execution and response times.

In extreme cases, these times may span several seconds. Therefore, access via the web server is **not** suitable for directly actuating the motor and should **only** be used for startup/commissioning/diagnosis or troubleshooting.

Interface

The motor controller is equipped with a 10/100 MBit Ethernet interface. In this way it can be operated with all current Ethernet components (switches, PCs) and configured via the "NanoIP" web interface. This interface is also used to update the firmware via the "NanoFlash" tool.

Connection

If the motor controller is correctly connected to the other Ethernet components, the green LED on the Ethernet socket at connector X1 lights up.

When communication occurs and data packets are received or sent, the yellow LED on the socket flashes.

Hardware address

The motor controller does not have an IP address but is addressed via the hardware address printed on it (= MAC address). This address consists of 6 hex numbers with the syntax 44-AA-E8-xx-xx-xx.

The hardware address is unique and permanent, and is assigned during production. Usually it is only needed for the firmware update using NanoFlash. As soon as the bootloader has closed and the actual firmware goes into operation, communication is set forth via the TCP/IP protocol.

IP address

For this the motor controller requires a valid IP address. It can be obtained by the following methods:

- Static IP address: This address is defined by the user in NanoIP.
- DHCP: A DHCP server assigns the IP address to the motor controller.
- AutoIP: The motor controller autonomously determines a suitable IP address. This requires that the communication partner is located in the same subnetwork and that it also uses AutoIP.

Which method is used depends on the network environment and is defined by the network operator.

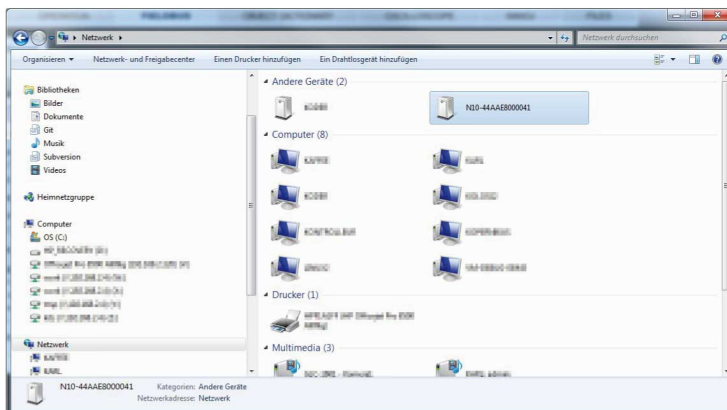

5.4.2 Integration in an existing network

Existing network

The motor controller can be readily integrated in an existing Ethernet network. This simply requires that the physical connection be established via the standard Ethernet cable. If DHCP and UPnP are activated on the motor controller (preset at the factory), the motor controller is automatically detected in the network and can immediately be operated using a PC into the network.

Motor controller in Windows Explorer

In the Windows Explorer, the motor controller can then simply be selected and the web interface can be started by double-clicking. In this case, it is not necessary to define a manual IP address.

PC direct connection

If a DHCP server is not available or if the motor controller does not appear in the Windows network environment for other reasons, an IP address must be manually assigned. .

Access to the user interface is then possible either by entering the IP address in the browser, or if UPnP is available, via the network environment.

5.4.3 OD entries for Ethernet

Object entries

For the function of the Ethernet, the following entries in the object directory are essential:

Index	Description
2010_h	IP configuration, bitmask with the following meaning: Bit 0: static IP address Bit 1: UPnP activated Bit 2: DHCP activated Bit 3: Auto IP activated Bit 4: IP activated Standard value: 0E _h (UPnP, DHCP, AutoIP and IP activated)
2011_h	Static IP address, 4 bytes in hex coding
2012_h	Static IP subnet mask, 4 bytes in hex coding
2018_h	Active IP address, 4 bytes in hex coding
2019_h	Active IP subnetwork mask, 4 bytes in hex coding
2020_h	NanoFlash static IP address, 4 bytes in hex coding
2021_h	NanoFlash static subnet mask, 4 bytes with hex coding
6503_h	Drive catalogue number/MAC address

Remarks

- If the web interface is started with the assistance of NanoFlash, the motor controller receives a temporary IP address with the associated subnet mask. It can be found in **2020_h/2021_h**. The static IP address set on the web interface can be found in **2011_h/2012_h**.
- If DHCP is activated and Auto IP is not active, the motor controller uses the set static IP address if no address could be assigned via DHCP (e.g. because the DHCP server is temporarily unavailable).

5.4.4 REST interface

Introduction

The web server protocol is HTTP/1.0. The architecture is implemented according to REST (Representational State Transfer) and makes it possible to access the web interface as well as other objects/resources. One example are the values in the object directory.

The supported operations are:

- GET: Requirements of a resource
- POST: Addition of a new resource
- PUT: Creation or changing of a new resource
- DELETE: Deletion of the resource

Resource name

The name of a resource is always specified in the URI (Uniform Resource Identifier) notation known from the Internet. Via this URI, the motor controller supports access to the filesystem (see "**Access to the file system**") and the object dictionary (see "**Access to the object directory**"). The identifiers are:

- Od: Object directory
- Fs: File system

Example

Access to a value in the object directory

`http://192.168.2.100/od/6040/00`

This string is used to access the entry **6040_n** subindex 0 in the object directory.

The response is in the form of a JSON String and reflects the content of this object.

Access to the file system

The following URIs enable access to the file system:

<IP address>/fs

Lists the root directory.

<IP address>/fs/dir

Lists the subdirectory.

<IP address>/fs/dir/file.xxx

Requests the "file .xxx" file from the "dir" directory.

Files are uploaded using the "put" command, downloaded via "get" and deleted with "delete".

CAUTION

Deletion of files can cause the motor controller to go into a non-functional state.

Access to the object directory

The following URIs enable access to the object directory:

<IP address>/od/xxxx/yy

Requests the entry xxxx subindex yy from the object directory.

<IP address>/fs/xxxx/data

Requests the entry xxxx with all subindices.

5.4.5 Information on problems

Troubleshooting notes

If problems occur when accessing the web interface, it may be helpful to check the following points:

Problem	Solution
Green LED on the Ethernet socket does not light up	<ul style="list-style-type: none"> • Replace the Ethernet cable • Replace the switch
The web interface cannot be started via NanoFlash	<ul style="list-style-type: none"> • Check the specified MAC address • Check the selected network card and establish a direct connection. • Replace the switch
The motor controller does not appear in the network environment	<ul style="list-style-type: none"> • Start the web interface with NanoFlash • Check if UPnP is activated (see UPnP-HowTo)
No access to the motor controller with NanoFlash, NanoFlash outputs an error	<ul style="list-style-type: none"> • Deactivate the Windows firewall • Deactivate the antivirus tool kits • Execute NanoFlash as an administrator

Problem	Solution
The web interface is not correctly displayed.	<ul style="list-style-type: none"> • Activate JavaScript in the browser
The motor controller is sporadically unavailable via the TCP/IP; PING no longer functions	<ul style="list-style-type: none"> • Check whether the set IP address has been assigned multiple times in the network
Although NanoFlash can communicate with the motor controller, the browser shows no content or the "Timeout message" after "Start NanoIP" is clicked	<ul style="list-style-type: none"> • Use another temporary IP address

6 Setup and commissioning

6.1 Safety instructions

WARNING

In residential areas, this product may cause high-frequency interference and may require interference suppression measures.

CAUTION

Alternating electromagnetic fields!

Alternating electromagnetic fields around current-carrying cables, especially around the supply and motor cables, can cause interference in the motor and other devices.

- A charging capacitor with 10000 μF and the necessary electric strength must be installed in the DC supply cable as close to the device as possible.
- An EMI filter (Würth Elektronik 74271112S or comparable) must be installed via the DC supply cable as close to the device as possible.
- An EMI filter (Würth Elektronik 74271222S or comparable) must be installed via the motor lines as close to the device as possible.
- Shield the cables. Run the shield connection on one side or both sides to a short earth.
- Use twisted pair cables.
- Keep power supply and motor cables as short as possible.
- Ground the motor housing large-area to a short earth.
- Run supply, motor and control cables separately.

6.2 Preparation

The following components are required for setup and installation:

- N5 motor controller
- Voltage supply in accordance with the data sheet
- Motor
- Lines for motor, possibly a line for the encoder

The following is required for the CAN interface:

- CANopen master
- and/or analyzer for CAN

An Ethernet cable is needed for the "Nanolp" web interface.

The following is required for the EtherCAT interface:

- EtherCAT Master
- Connecting lines for EtherCAT

6.3 CANopen set up and installation

Read the "CANopen" section in "Configuration" if you have not already done so.

1. Turn the rotary switch of the motor controller to position "1" (see the "**CANopen**" section). This sets the NodeID to "1" and the baud rate to 1 MBd.
2. Connect the CANopen Master or a comparable CAN device to the connector of X8 (see the "**CANopen Bus IN (connector X8)**" section)
3. Configure the CANopen master or comparable device to a baud rate of 1 MBd.
4. Connect the voltage supply to connector X6 of the motor controller (see the "**Motor controller voltage supply (connector X6)**" section).
5. The motor controller must transmit a CANopen bootup message.

If a node ID other than 1 to 127 is required, continue with the "**Change NodeID**" section.

If the baud rate has to be adapted, continue with the "**Change baud rate**" section.

If you wish to operate the motor controller/motor in closed loop mode, continue with the **Auto-setup mode** .

If the bootup message could not be received, please check the following points:

- Rotary switch correctly engaged a number "1".
- Termination needed – switch on the terminating resistor as described in the "**Terminating resistor**" section.
- Check the CAN HIGH/LOW cabling, check the CAN-GND connection.
- Check the CANopen master or comparable CAN device for the baud rate of 1 MBd.

6.3.1 Change NodeID

CANopen

Note

This option is currently not supported. The NodeID can only be changed via the web interface at this time (see the "**Ethernet**" section).

Make sure that you have access to the motor controller over CANopen.

1. The NodeID is set by object **2009_h**. Send a CANopen-SDO message with the future NodeID to the object **2009_h**.
2. Save the new specification by sending the value **65766173_h** (decimal **1702257011** or ASCII "SAVE") to object **1010_h:02_h**.
3. Turn the rotary switch
 - to "1" to "127" if the NodeID is to get this value.
 - to "128" if the NodeID is to be taken from object **2005_h**.
4. Restart the motor controller by
 - either briefly disconnecting the voltage supply
 - or sending the message "RESET COMM" to the motor controller (CobID = 0, byte 0 = 82_h, byte 1 = old NodeID)

Note

Should there be problems with the change of NodeID, set the rotary switch to the value "1" to "127". The NodeID now corresponds to the set value, and access to the object directory is again possible.

6.3.2 Change baud rate

Note

This option is currently not supported. The baud rate can only be changed via the web interface at this time (see the "**Ethernet**" section).

Make sure that you have access to the motor controller over CANopen.

1. The baud rate is set by object **2005_h**. The assignment can be read in the table in the "**Baud rate**" section. Send a CANopen-SDO message with the value of the future baud rate to object **2005_h**.
2. Save the new specification by sending the value **65766173_h** (decimal **1702257011** or ASCII "SAVE") to object **1010_h:02_h**.
3. Turn the rotary switch
 - to "0", if the baud rate is to be permanently set at 1 MBd.
 - to "128" if the baud rate is to be taken from object **2005_h**.
4. Disconnect the motor controller from the voltage supply.
5. Adapt the CANopen master to the new baud rate.
6. Reconnect the voltage supply for the motor controller. This must cause the motor controller to report again with the bootstrap message.

Note

Should there be problems with the change of baud rate, set the rotary switch to the value "1" to "127". The baud rate now corresponds to the value of 1 MBd, and access to the object directory is again possible.

6.4 Ethernet

Read the "**Ethernet interface**" section in "**Configuration**" if you have not already done so. Make sure that you have access to the motor controller over NanoIP.

The motor controller has the `canopen.on` file available, which contains the basic settings for CANopen. This file is loaded after the motor controller is switched on. The file is located in the directory `/FS/CONFIG/STARTUP/`

The file is in "JavaScript Object Notation" (JSON). Each row describes an object and always has the same structure.

```
"INDEX": {"SUBINDEX": "VALUE", "SUBINDEX": "VALUE" [...]},
```

All numbers are hexadecimal, where the leading `0x` is not notated, although all leading zeros are. Each value is surrounded by quotation marks; thus, for example, the index **1800_h** is notated as "1800". The subindex must always be notated; in the event of a variable – such as **6040_h** – the value must be written to the subindex 0.

The subindices are always written in pairs with "SUBINDEX": "VALUE". The value must be filled with leading zeros until the length matches that of the data type.

Example

- The object **1800_h:02_h** (Unsigned08) and **03_h** (Unsigned16) of the type is notated as follows: "1800": {"02": "00", "03": "0000"},
- The object **6040_h:00_h** of the type Unsigned16 is fully notated as follows: "6040": {"00": "0006"},

To change the NodeID, proceed as follows:

1. Download the file CANOPEN.ON from the motor controller.
 - a. On a PC, open the website of the motor controller.
 - b. Change to the "Files" tab.
 - c. In "Directories and Files", navigate to the directory "FS/CONFIG/STARTUP" and select the "CANOPEN.ON" file.
 - d. Click on the "Download" button.
 - If the file is opened in a new tab, click on the text of the homepage with the right mouse key, select the item "Save page as" and enter the target directory on the PC.

- If the "Save as" dialog opens, enter the target location on the PS.
2. Open the file with a text editor.
 - To change the baud rate, search for the row with the entry "2005": {"00": "87"} and change the value as described in **2005_h**.
 - To change the NodeID, search for the line with the entry "2009": {"00": "01"} and change the value to the desired NodeID.
 3. Save your changes in the CANOPEN.ON file.
 4. Load the file back onto the motor controller.
 - a. On a PC, open the website of the motor controller.
 - b. Change to the "Files" tab.
 - c. In "Directories and Files", navigate to the directory "FS/CONFIG/STARTUP" and click on the "Search" button.
 - d. Select the modified file CANOPEN.ON on your PC.
 - e. Click on the "Upload" button
 - f. Do not make any more entries until the file upload is completed.

7 Operating modes

7.1 Profile Position

7.1.1 Overview

Description

The Profile Position Mode is used to move to positions relative to the last target position or to the absolute last reference position. During the movement, the limit values for the speed, acceleration and deceleration and jerks are taken into account.

Activation

To activate the mode, the value "1" must be set in object **6060_h** (Modes Of Operation) (see "**DS402 Power State machine**").

Control word

The following bits in object **6040_h** (control word) have a special function:

- Bit 4 starts a travel order. This is carried out on a transition of "0" to "1".
- Bit 5: If this bit is set to "1", a travel order triggered by bit 4 is immediately carried out. If it is set to "0", the travel order just being carried out is completed and only then is the next travel order started.
- Bit 6: If "0", the target position (**607A_h**) is absolute and if "1", the target position is relative to the actual position.
- Bit 9: If this bit is set, the speed is not changed until the first target position is changed. This means that braking is not performed before the first destination is reached as the motor should not stop at this position.

Controlword 6040 _h		
Bit 9	Bit 5	Definition
X	1	The new target position is moved to immediately.
0	0	The positioning is not completed until the next target position is being moved to with the new limitations.
1	0	The current speed is held until the current target position is reached, and only then is the new target position moved to with the new values.

See the figure in "**Setting move commands**".

Status word

The following bits in object **6041_h** (status word) have a special function:

- Bit 10: Target reached: This bit is set to "1" when the last target was reached and the motor is idling for a specified time (**6068_h**) within a tolerance window (**6067_h**).
- Bit 12 (set-point acknowledge): This bit confirms the receipt of a new and valid time. It is synchronously set and reset with the "New set-point" bit in the control word.

An exception is if a new travel is started when another travel has not yet been completed and the next travel should only be carried out after the end of the first travel. In this case, the bit is only reset when the command has been accepted and the motor controller is ready to carry out new move commands. If a new travel order is sent although this bit is still set, the latest travel order is ignored.

The bit is not set if one of the following conditions occurs:

- The new target position can no longer be reached if the marginal conditions are adhered to.
- A target position has already been moved to and a target position has already been specified. A new target position cannot be specified until the current positioning has been completed.

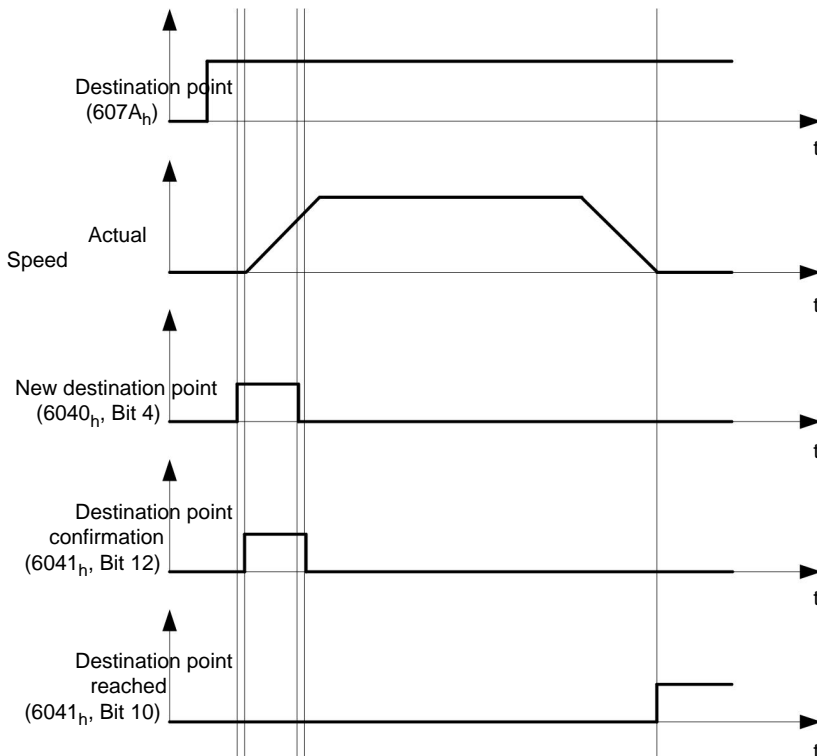

- The new position is outside of the valid range (**607D_h** (Software Position Limit)).
- Bit 13 (Following Error): This bit is set in closed loop mode if the following error is greater than the set limits is (**6065_h** (Following Error Window) and **6066_h** (Following Error Time Out)).

7.1.2 Setting move commands

Move command

In object **607A_h** (Target Position), the new target position is specified in user units (see "User-defined units"). Afterwards, the move command is triggered when bit 4 is set in object **6040_h** (control word). If the target position is valid, the motor controller responds with bit 12 in object **6041_h** (status word) and begins the positioning run. As soon as the position is reached, bit 10 is set to "1" in the status word.

Profile of the move command

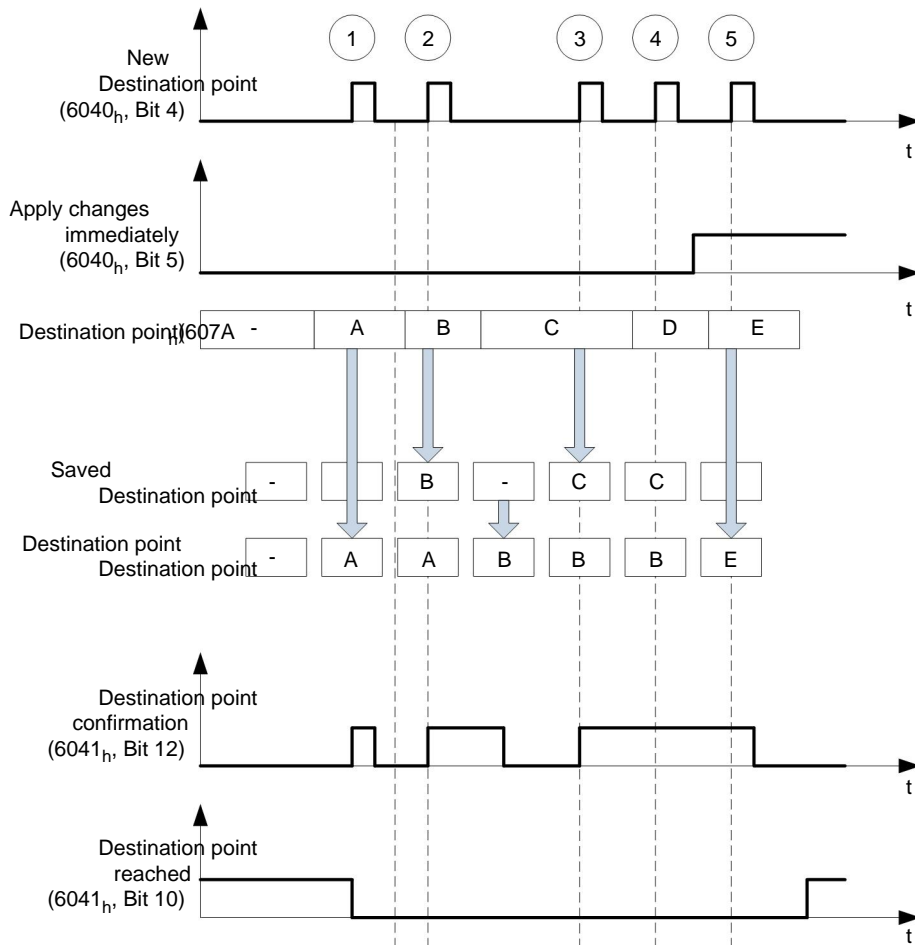

Further move commands

Bit 12 in object **6041_h** (status word, set-point acknowledge) changes to "0" if another move command can be buffered (see time 1 in the following diagram). While a target position is being moved to, a second target position can be transferred to the motor controller in preparation. All parameters – such as speed, acceleration, deceleration, etc. – can be reset (time 2). After the buffer is empty again, the next time can be added to the sequence (time 3).

If the buffer is already full, a new time is ignored (time 4). If bit 5 in object **6040_h** (control word, bit: "Change Set-Point Immediately") is set, the motor controller operates without the buffer and new move commands are implemented directly (time 5).

Times

Transition procedure for second target position

The following graphic shows the transition procedure for the second target position while the first target position is being moved to. In this figure, bit 5 of object 6040_h (control word) is set to "1" and the new target value is adopted immediately.

Options for moving to a target position

If bit 9 in object **6040_h** (control word) is "0", the actual target position is first moved to completely. In this example, the end speed (**6082_h**) of the first target position is zero. If bit 9 is set to "1", the end speed is held until the target position is reached; only then do the new marginal conditions apply.

7.1.3 Marginal conditions for a positioning run

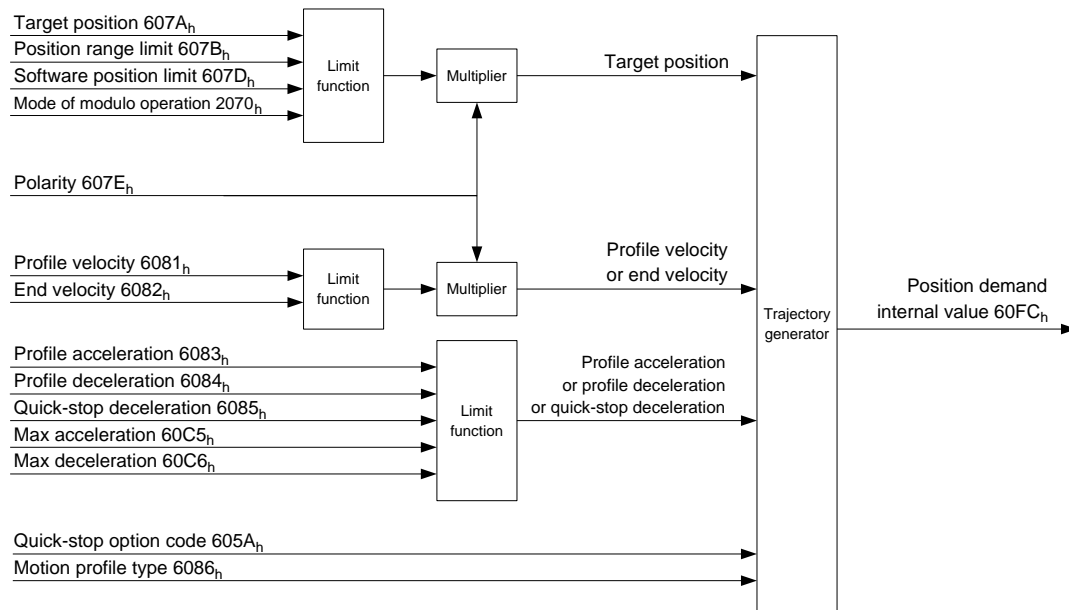

Object entries

The marginal conditions for the position to which the run is made can be set in the following entries of the object directory:

- **6064_h** (Position Actual Value): Actual position of the motor
- **607A_h** (Target Position): Planned target position
- **607B_h** (Position Range Limit): Definition of the limit stops (see the section below)
- **607C_h** (Home Offset): Shifting of the machine zero point (see "Homing")
-
- **607E_h** (Polarity): Direction of rotation
- **6081_h** (Profile Velocity): Maximum speed with which the position should be moved to
- **6082_h** (End Velocity): Speed when reaching the target position
- **6083_h** (Profile Acceleration): Required acceleration
- **6084_h** (Profile deceleration): Required deceleration
- **6085_h** (Quick Stop Deceleration): Emergency stop deceleration in case of the "Quick stop active" state of the "DS402 Power State machine"
- **6086_h** (Motion Profile Type): Type of ramp to be moved to; if the value is "0", jerk is not limited, if value is "3", the values from 60A4_h:1_h - 4_h are set as jerk limitations.
- **60C5_h** (Max Acceleration): The maximum acceleration that may not be exceeded when moving to the end position.
- **60C6_h** (Max Deceleration): The maximum deceleration that may not be exceeded when moving to the end position
- **60A4_h** (Profile Jerk), subindex 01_h to 04_h : Objects for describing the limit values for the jerk

Objects for the positioning run

The following graphic shows the objects involved for the marginal conditions for the positioning run.

Parameters for the target position

The following diagram shows an overview of the parameters that are used for moving to a target position (figure is not to scale).

7.1.4 Jerk-limited and non-jerk-limited mode

Description

Two basic modes exist: the "jerk-limited" and "non-jerk-limited" mode.

Jerk-limited mode

A jerk-limited positioning is achieved by setting object **6086_h** to "3". This causes the entries for the jerks in object **60A4_h:01_h-04_h** to become valid.

Non-jerk-limited mode

A "0" in an entry means that there is no jerk limitation at the particular point in the profile.

If all four entries of object **60A4_h** are set to "0", a non-jerk-limited ramp is traveled.

A "non-jerk-limited" ramp is traveled in two ways: either all values of the jerk in the entries **60A4_h:01_h** to **60A4_h:04_h** are set to "0" and the object **6086_h** is set to "3", or the entry in the object **6086_h** is set to "0".

7.2 Velocity

7.2.1 Description

This mode operates the motor with a specified target in a manner similar to a frequency converter. In contrast to profile velocity mode, this mode operates without a speed monitor and does not permit jerk-limited ramps to be selected.

7.2.2 Activation

To activate the mode, the value "2" must be set in object **6060_h** (Modes Of Operation) (see "**DS402 Power State machine**").

7.2.3 Control word

The following bits in object **6040_h** (control word) have a special function:

- Bit 2 is used to trigger a quick stop. If it is set to "0", the motor carries out a quick stop with the ramp set in object **604A_h**. Then the motor controller changes to the "Switch on disabled" state (see **6040_h**).
- Bit 8 (Stop): On a transition of "0" to "1" the motor accelerates up to the target speed with the set acceleration ramp. On a transition of "1" to "0", the motor brakes according to the brake ramp and comes to a stop.

7.2.4 Status word

The following bits in object **6041_h** (status word) have a special function:

- Bit 11: Limit exceeded: The target speed exceeds or undercuts the entered limit values.

7.2.5 Object entries

The following objects are required to control this mode:

- **604C_h**(Dimension Factor):

The unit for the speed specifications for the following objects are defined here. If subindices 1 and 2 are set to value "1", the speed is indicated in revolutions per minute.

Otherwise, subindex 1 contains the multiplier and subindex 2 the divisor with which the speed specifications are computed. The result is interpreted as revolutions per second; at object **2060_h**, the selection is made of whether these are electrical (**2060_h= 0**) or mechanical (**2060_h= 1**) revolutions per second.

The target speed is set in user units here.

- **6042_h**: Target Velocity
- **6048_h**: Velocity Acceleration

This object defines the start acceleration. Subindex 1 contains the speed change, and subindex 2 the associated time in seconds. Both together are computed as the acceleration:

$$\text{VL velocity acceleration} = \frac{\text{Delta speed (6048}_{h};1)}{\text{Delta time (6048}_{h};2)}$$

- **6049_h** (Velocity Deceleration):

This object defines the deceleration. The subindices are structured as described in object **6048_h**, and the speed difference must be indicated by a positive sign.

- **6085_h** (Quick Stop Deceleration):

Emergency stop deceleration in case of the "Quick stop active" state of the "DS402 Power State machine"

- **6046_h** (Velocity Min Max Amount):

In this object the limitations to target speeds are specified.

The minimum speed is set in **6046_h:01_h**. If the target speed (**6042_h**) drops below the minimum speed, the value is limited to the minimum speed **6046_h:01_h**.

The maximum speed is set in **6046_h:02_h**. If the target speed (**6042_h**) exceeds the maximum speed, the value is limited to the maximum speed **6046_h:02_h**.

- **604A_h** (Velocity Quick Stop):

The quick stop ramp can be set with this object. Subindices 1 and 2 are the same as specified for object **6048_h**.

Speeds in Velocity Mode

Objects for the Velocity Mode

The ramp generator follows the target speed while adhering to the set speed and acceleration limits. Bit 11 is set in object **6041_h** (internal limit active) when a limitation is active.

7.3 Profile Velocity

7.3.1 Description

This mode operates the motor in Velocity Mode with expanded ramps. Unlike velocity mode (see "**Velocity**"), the actual speed can be monitored via an external encoder in this mode.

7.3.2 Activation

To activate the mode, the value "3" must be set in object **6060_h** (Modes Of Operation) (see "**DS402 Power State machine**").

7.3.3 Control word

The following bits in object **6040_h** (control word) have a special function:

- Bit 2 is used to trigger a quick stop. If it is set to "0", the motor carries out a quick stop with the ramp set in object **6085_h**. Then the motor controller changes to the "Switch on disabled" state (**6040_h**).

- Bit 8 (Stop): On a transition of "0" to "1", the motor accelerates up to the target speed with the set starting ramp. On a transition of "1" to "0", the motor brakes and comes to a stop.

7.3.4 Status word

The following bits in object **6041_h**(status word) have a special function:

- Bit 10 (target speed reached); Target Reached: This bit in combination with bit 8 in the control word indicates whether or not the target speed has been reached, the motor is braking, or the motor is idling (see table).

6041_h Bit 10	6040_h Bit 8	Description
0	0	Target speed attained
0	1	Axis is braking
1	0	The target speed within the target window (defined in 606D_h and 606E_h)
1	1	Speed of axis is 0

7.3.5 Object entries

The following objects are required to control this mode:

- **606B_h**(Velocity Demand Value):
This object contains the output of the ramp generator which is the specified value for the speed controller at the same time.
- **606C_h**(Velocity Actual Value):
Specifies the current actual speed.
- **606D_h**(Velocity Window):
This value specifies by how much the actual speed may vary from the set speed for bit 10 (target speed reached; Target Reached) in object **6041_h**(status word) is to be set to "1".
- **606E_h**(Velocity Window Time):
This object indicates how long the actual speed and the set speed must be near each other in magnitude (see **606D_h**"Velocity Window") for bit 10 "Target Reached" in object **6041_h**(status word) to be set to "1".
- **607E_h**(Polarity):
If bit 6 is set to "1", the sign (plus/minus) of the target speed is reversed.
- **6083_h**(Profile acceleration):
Sets the value for the acceleration ramp in velocity mode.
- **6084_h**(Profile Deceleration):
Sets the value for the braking ramp in velocity mode.
- **6085_h**(Quick Stop Deceleration):
Sets the value for the braking ramp for the quick stop in velocity mode.
- **6086_h**(Motion Profile Type):
Here the ramp type can be selected (0 = trapezoid ramp, 3 = jerk-limited ramp).
- **604A_h**(Velocity Quick Stop), subindex 01_h to 04_h :
The four jerk values are specified here if a jerk-limited ramp is set.
- **60FF_h**(Target Velocity):
Specifies the target speed to be attained.
- **2031_h**(Peak Current):
Maximum current in mA

Objects in Profile Velocity Mode

Mode activation

After the mode was selected in object **6060_h** (Modes of Operation) and the "Power State machine" (see "DS402 Power State machine") was switched to "Operation Enabled", the motor is accelerated to the target speed in **60FF_h** (see the following diagrams). The speed, the acceleration and, in the case of jerk-limited ramps, the jerk limited values are taken into account.

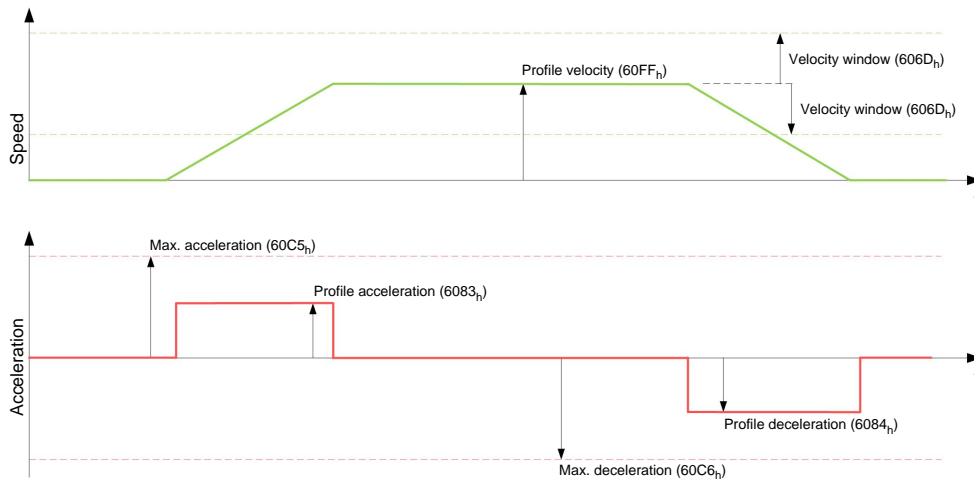

Limitations in the jerk-limited case

The following diagram shows the adjustable limitations in the jerk-limited case (**6086_h=3**).

Limitations in trapezoid case

This diagram shows the adjustable limitations for the trapezoid case (**6086_h=0**).

7.4 Profile torque

7.4.1 Description

In this mode, the torque is specified as the set point and is moved to via a ramp function.

7.4.2 Activation

To activate the mode, the value "4" must be set in object **6060_h**(Modes Of Operation) (see "**DS402 Power State machine**").

7.4.3 Control word

The following bits in object **6040_h**(control word) have a special function:

- Bit 8 (Stop): If this bit is set to "0", the motor is started according to the specifications. When set to "1", the motor is brought to idling according to the specified values.

7.4.4 Status word

The following bits in object **6041_h**(status word) have a special function:

- Bit 10 (Target Reached): This bit in combination with bit 8 of object **6040_h**(control word) indicates whether or not the specified torque has been reached (see the following table).

6040_h	6041_h	Description
Bit 8	Bit 10	
0	0	Specified torque not attained
0	1	Specified torque attained
1	0	Axis accelerated
1	1	Speed of axis is 0

7.4.5 Object entries

All values of the following entries in the object directory must be specified as one thousandth of the maximum torque, which corresponds to the maximum current (**2031_h**). This includes the following objects:

- **6071_h**(Target Torque):
Target value of the torque
- **6072_h**(Max Torque):
Maximum torque during the entire ramp (acceleration, hold torque, brake)

- **6074_h**(Torque Demand):
Current output value of the ramp generator (torque) for the control
- **6087_h**(Torque Slope):
Maximum change of the torque per second
- **3202_h** Bit 5 (Motor Drive Submode Select):
If this bit is set to "0", the drive control is operated in torque-limited velocity mode, i.e. the maximum speed can be limited in object **2032_h** and the control can work in field weakening mode.
If this bit is set to "1", the control works in torque mode, the maximum speed cannot be limited here and field weakening mode is not possible.

Objects of the ramp generator

Torque curve

7.5 Homing

7.5.1 Overview

Description

The purpose of the reference run (homing method) is to synchronize the motor controller with the encoder index of the motor or position switch in a system.

Activation

To activate the mode, the value "6" must be set in object **6060_h**(Modes Of Operation) (see "**DS402 Power State machine**").

If a reference and/or limit switch is used, these special functions first need to be activated in the I/O configuration (see "**Digital inputs and outputs**").

Control word

The following bits in object **6040_h**(control word) have a special function:

- Bit 2 is used to trigger an quick stop. If it is set to "0", the motor carries out a quick stop with the ramp set in object **6085_h**. The motor then goes into "Switch on disabled" mode (see the "**DS402 Power State machine**" section).
- Bit 4: If the bis is set to "1", the referencing is started. This is set forth until either the reference position is reached or bit 4 is set to "0" again.

Status word

The following bits in object **6041_h**(status word) have a special function:

Bit 13	Bit 12	Bit 10	Description
0	0	0	Homing procedure is in progress
0	0	1	Homing procedure is interrupted or not started
0	1	0	Homing is attained, but target is not reached
0	1	1	Homing procedure is completed successfully
1	0	0	Homing error occurred, velocity is not 0
1	0	1	Homing error occurred, velocity is 0

Object entries

The following objects are required to control this mode:

- **6098_h**(Homing Method):
Method used for referencing (see "**Reference run method**")
- **6099_h:01_h** (Speed During Search For Switch):
The speed for the search for the switch
- **6099_h:02_h** (Speed During Search For Zero):
The speed for the search for the index
- **609A_h**(Homing Acceleration):
Acceleration and deceleration for the reference run
- **2056_h**(Limit Switch Tolerance Band):
After moving to the positive or negative limit switch, the motor controller permits a tolerance range that the motor may not further travel. If this tolerance range is exceeded, the motor stops and the motor controller changes to the "Fault" state. If limit switches can be activated during the reference run, the tolerance range selected should be sufficiently large so that the motor does not leave the tolerance range when braking. Otherwise, the reference run cannot be completed successfully. After completion of the reference run, the tolerance range can be set back to "0" if this is required by the application.
- **203A_h:01_h** (Minimum Current For Block Detection):
Minimum current threshold that, when exceeded, detects blocking of the motor at a block.
- **203A_h:02_h** (Period Of Blocking):
Specifies the time in ms that the motor is nevertheless still to travel against the block after block detection.
- **203A_h:03_h** (Block Detection Time)
Specifies the time in ms that the current has to be at least above the minimum current threshold in order to detect a block

Speeds of the reference run

The figure shows the speeds of the reference run using method 4 as an example:

7.5.2 Reference run method

Description

The reference run method is written into object 6098_h as a number and defines whether referencing should be performed on a switch flank (rising/falling), a current threshold for block detection or an index pulse is referenced, or in which direction the reference run should start. Methods that use the index pulse of the encoder are within the number range 1 to 14, 33 and 34. Methods that reference a limit switch are between 17 and 30, but their travel profiles are identical with those of the methods 1 to 14. These numbers are shown in circles in the following figures. Methods that do not use a limit switch, and instead travel against a block is to be detected, must be called up with a minus in front of the method number.

For the following diagrams, the negative movement direction is to the left. The limit switch is located in front of the mechanical block in each case, and the reference switch (home switch) is between the two limit switches. The index pulses come from the encoder, which is connected with the motor shaft and motor controller.

For methods that use homing on block, the same illustrations apply as for the methods with limit switch. New illustrations are not shown as nothing changes except for the missing limit switches. In this case, the limit switches have to be replaced by a mechanical block in the illustrations.

Homing on block

Homing on block functions perfectly only in closed loop mode at the moment. The finer points that have to be observed for homing on block in closed loop mode, for instance, are given in detail in the section on controls.

For certain applications it is appropriate to travel against the block for a specific time after a block has been detected. This time can be set in object **203A_h:02_h** in ms.

To ensure very precise detection of the block, the block should be traveled against with a very low speed (**6099_h:01_h**), high current limit (**203A_h:01_h**), and high homing acceleration (**609A_h**). Additionally, detection can be refined by the block detection time (**203A_h:03_h**).

Methods overview

Methods 1 to 14, and 33 and 34 use the index pulse of the encoder.

Methods 17 to 32 are identical with the methods 1 to 14 with the exception that referencing is only performed on the limit or home switch and not on the index pulse.

- Methods 1 to 14 contain an index pulse
- Methods 15 and 16 do not exist
- Methods 17 to 30 do not have an index pulse
- Methods 31 and 32 do not exist
- Methods 33 and 34 reference only to the next index pulse
- Method 35 references to the actual position

The following methods can be used for homing on block:

- Methods -1 to -2 and -7 to -14 contain an index pulse
- Methods -17 to -18 and -23 to -30 do not have an index pulse

Methods 1 and 2

Reference the limit switch and index pulse.

Method 1 references a negative limit switch and index pulse:

Method 2 references a positive limit switch and index pulse:

Methods 3 to 6

These methods reference the switch flank of the reference switch and index pulse.

In the methods 3 and 4, the left switch flank of the reference switch is used as a reference:

In the methods 5 and 6, the right switch flank of the reference switch is used as a reference:

Methods 7 to 14

These methods reference the home switch and index pulse (with limit switches).

For these methods, the actual position relative to the reference switch is unimportant. With method 10, referencing is for instance always to the index pulse on the right next to the right flank of the reference switch.

The methods 7 to 10 take the positive limit switch into account:

The methods 11 to 14 take the negative limit switch into account:

Methods 17 and 18

These methods reference the limit switch without the index pulse.

Method 17 references the negative limit switch:

Method 18 references the positive limit switch:

Methods 19 to 22

These methods reference the switch flank of the reference switch without the index pulse.

In the methods 19 and 20 (equivalent to methods 3 and 4), the left switch flank of the reference switch is used as a reference:

In the methods 21 and 22 (equivalent to methods 5 and 6), the right switch flank of the reference switch is used as a reference:

Methods 23 to 30

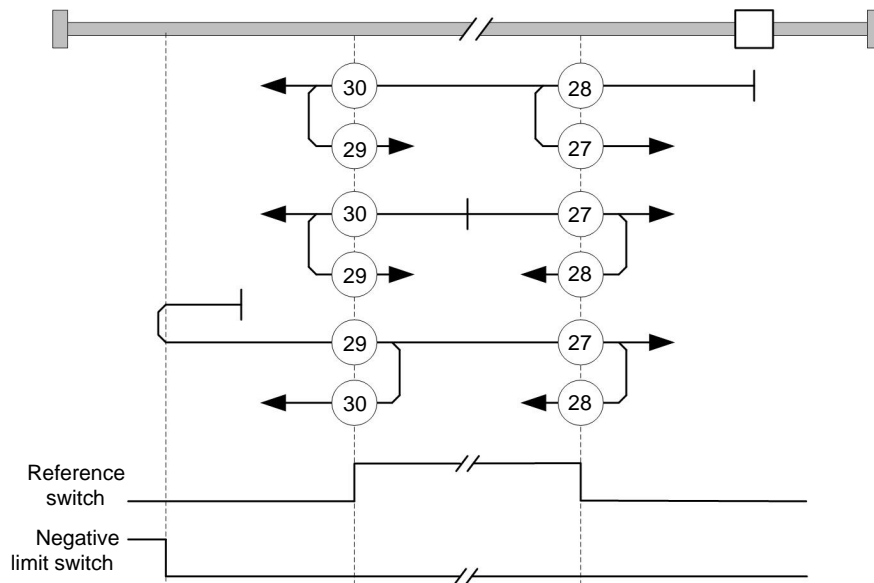

These methods reference the home switch without the index pulse (with limit switches).

For these methods, the actual position relative to the reference switch is unimportant. With method 26, referencing is for instance always to the index pulse on the right next to the right flank of the reference switch.

The methods 23 to 26 take the positive limit switch into account:

The methods 27 to 30 take the negative limit switch into account:

Methods 33 and 34

Reference the next index pulse.

For these methods, referencing is only to respective next index pulse:

Method 35

References to the actual position.

7.6 Cyclic Synchronous Position

7.6.1 Overview

Description

In this mode, the motor controller receives an absolute positional specification at fixed time intervals (called "cycles" below) via the field bus. In this case, the motor controller no longer computes ramps but only follows the specifications.

The target position is transferred via PDO, to which the motor controller responds promptly. Bit 4 in the control word does not have to be set (in contrast to **Profile Position** mode).

Note

The target specification is absolute and thus independent of how often it was sent per cycle.

Activation

To activate the mode, the value "8" must be set in object **6060_h** (Modes Of Operation) (see "**DS402 Power State machine**").

Control word

In this mode, the bits of control word **6040_h** do not have a special function.

Status word

The following bits in object **6041_h** (status word) have a special function:

Bit	Value	Description
10	0	Reserved
10	1	Reserved
12	0	The motor controller does not follow the target specification; the specification of the 607A_h (Target Position) is ignored.
12	1	The motor controller follows the target specification; the object 607A_h (Target Position) is used as the input for the position control.
13	0	Reserved
13	1	Reserved

7.6.2 Object entries

The following objects are required to control this mode:

- **607A_h** (Target Position): The position set value must be cyclically written to this object.
- **607B_h** (Position Range Limit): This object contains the specification for an overflow or underflow of the position value.
- **607D_h** (Software Position Limit): This object specifies the limits within which the position specification must be found (**607A_h**).
- **6065_h** (Following Error Window): This object specifies a tolerance corridor in both the positive and negative direction from the set specification. If the actual position is outside of this corridor for longer than the specified time (**6066_h**), a "following error" is issued.
- **6066_h** (Following Error Time Out): This object specifies the time period in milliseconds. If the actual position is outside of the position corridor (**6065_h**) for longer than this time period, a "following error" is issued.
- **6085_h** (Quick-Stop Deceleration): This object contains the deceleration in case a Quick Stop is triggered.
- **605A_h** (Quick-Stop Option Code): This object contains the option that is to be executed in the event of a Quick Stop.
- **60C2_h:01_h** (Interpolation Time Period): This object specifies the time period of a cycle. Within this time period, a new set value must be written to **607A_h**.

The following applies: cycle time = value of the **60C2_h:01_h** * 10^{value of 60C2:02} seconds.

At this time, only cycle times should be used that correspond to a power of two, i.e. 1, 2, 4, 8, 16, etc. The time unit of the cycle time is defined by object **60C2_h:02_h**.

- **60C2_h:02_h** (Interpolation Time Index): This object specifies the time basis for cycles. At this time, only the value **60C2_h:02_h=-3** is supported, which results in a time basis of 1 millisecond.
- **2031_h** (Peak Current): This object specifies the maximum current in mA.

7.7 Cyclic Synchronous Velocity

7.7.1 Overview

Description

In this mode, the motor controller receives a speed specification at fixed time intervals (called "cycles" below) via the field bus. In this case, the motor controller no longer computes ramps but only follows the specifications.

The target position is transferred via PDO, to which the motor controller responds promptly. Bit 4 in the control word does not have to be set (in contrast to **Profile Velocity** mode).

Activation

To activate the mode, the value "9" must be set in object **6060_h** (Modes Of Operation) (see "**DS402 Power State machine**").

Control word

In this mode, the bits of control word **6040_h** do not have a special function.

Status word

The following bits in object **6041_h** (status word) have a special function:

Bit	Value	Description
10	0	Reserved
10	1	Reserved
12	0	The motor controller does not follow the target specification; the specification of the 60FF_h (Target Velocity) is ignored.
12	1	The motor controller follows the target specification; the object 60FF_h (Target Velocity) is used as the input for the position control.
13	0	No following error
13	1	Following error

7.7.2 Object entries

The following objects are required to control this mode:

- **60FF_h** (Target Velocity): The speed set value must be cyclically written to this object.
- **6085_h** (Quick-Stop Deceleration): This object contains the deceleration in case a Quick Stop is triggered (see "**DS402 Power State machine**").
- **605A_h** (Quick-Stop Option Code): This object contains the option that is to be executed in the event of a Quick Stop (see "**DS402 Power State machine**").
- **60C2_h:01_h** (Interpolation Time Period): This object specifies the time period of a cycle. Within this time period, a new set value must be written to **60FF_h**.

The following applies: cycle time = value of the **60C2_h:01_h** * 10^{value of 60C2:02} seconds.

At this time, only cycle times should be used that correspond to a power of two, i.e. 1, 2, 4, 8, 16, etc. The time unit of the cycle time is defined by object **60C2_h:02_h**.

- **60C2_h:02_h** (Interpolation Time Index): This object specifies the time basis for cycles. At this time, only the value **60C2_h:02_h = -3** is supported, which results in a time basis of 1 millisecond.
- **2031_h** (Peak Current): This object specifies the maximum current in mA.

7.8 Cyclic Synchronous Torque

7.8.1 Overview

Description

In this mode, the motor controller receives an absolute torque value at fixed time intervals (called "cycles" below) via the field bus. In this case, the motor controller no longer computes ramps but only follows the specifications.

The target position is transferred via PDO, to which the motor controller responds promptly. Bit 4 in the control word does not have to be set (in contrast to **Profile torque** mode).

Activation

To activate the mode, the value "10" must be set in object **6060_h** (Modes Of Operation) (see "**DS402 Power State machine**").

Control word

In this mode, the bits of control word **6040_h** do not have a special function.

Status word

The following bits in object **6041_h** (status word) have a special function:

Bit	Value	Description
10	0	Reserved
10	1	Reserved
12	0	The motor controller does not follow the target specification; the specification of the 6071_h (Target Torque) is ignored.
12	1	The motor controller follows the target specification; the object 6071_h (Target Torque) is used as the input for the position control.
13	0	Reserved
13	1	Reserved

7.8.2 Object entries

The following objects are required to control this mode:

- **6071_h** (Target Torque): The torque set value must be cyclically written to this object.
- **60C2_h:01_h** (Interpolation Time Period): This object specifies the time period of a cycle. Within this time period, a new set value must be written to **60FF_h**.

The following applies: cycle time = value of the **60C2_h:01_h** * 10^{value of 60C2:02} seconds.

At this time, only cycle times should be used that correspond to a power of two, i.e. 1, 2, 4, 8, 16, etc. The time unit of the cycle time is defined by object **60C2_h:02_h**.

- **60C2_h:02_h** (Interpolation Time Index): This object specifies the time basis for cycles. At this time, only the value **60C2_h:02_h = -3** is supported, which results in a time basis of 1 millisecond.
- **2031_h** (Peak Current): This object specifies the maximum current in mA.

7.9 Auto-setup mode

7.9.1 Overview

Notes

CAUTION

Prerequisites for performing the auto setup are:

- The motor must be load-free.
- The motor must not be touched.
- The motor must be able to rotate freely in any direction.

Complex computations are performed during auto setup. Often this results in a lack of sufficient computing power to operate the field buses in a timely manner. The buses may be impaired during auto setup.

Description

The auto-setup function ascertains the following data of the connected motor in the course of multiple testing and measuring cycles:

- Pole pair count
- Encoder resolution
- Index width
- Alignment (shifting of the electrical zero point to the index)
- Compensation of encoder running inaccuracies

Activation

To activate the mode, the value "-2" (=FE_h) must be set in object **6060_h** (Modes Of Operation).

Control word

The following bits in object **6040_h** have a special function:

- Bit 4: Starts the auto setup. The start is carried out on a transition of "0" to "1".
- Bit 6: With "0", all values are determined; with "1", only the encoder for the closed loop mode is measured (alignment, smooth running). For this purpose, the pole pair count (**2030_h**) and encoder resolution (**2052_h**) values must be preassigned.

Status word

The following bits in object **6041_h** have a special function:

- Bit 10: Indexed: This bit is set to "1" when the index is overrun the first time.
- Bit 12: Aligned: This bit is set to "1" after the encoder alignment is performed.
- Bit 13: Optimized: This bit is set to "1" after the encoder concentricity measurement is performed.

Two phases

The auto setup procedure is subdivided into two phases:

- Measurement (see "**Measurement**")
- Parameter test (see "**Parameter test**")

7.9.2 Measurement

Description

In this step, the motor parameters required for the open loop modes and closed loop modes are determined one after the other.

Error

During measurement, the following errors (**1003_h**) can occur:

Error code	Description	Solution approach
09207305 _h	A/B pulses were not detected while the motor was rotating.	Is an encoder connected? Are the A and B tracks correctly connected?
07207305 _h	Sensor fault. Occurs when a shift in the index position is detected. To correct the fault, the motor controller must be unplugged and plugged in again.	Is the shield at the encoder line correctly connected?

Error code	Description	Solution approach
08207305 _h	The index pulse was not detected.	Is the index correctly connected? Does the motor have a higher pole pair count than 200?

Completion

After measurement, the motor controller restarts automatically and performs the parameter test (see "Parameter test").

7.9.3 Parameter test

Test

In this step, the drive is automatically switched into the profile torque mode and the field-generating current I_d is gradually increased until the maximum current (2031_h) is reached or the motor begins to move.

The reached current level is used as a benchmark for the grade of the measured parameter. Ideally, the current I_d can be increased without the motor moving.

Completion

If the current level is over 50% of the maximum current (2031_h), the test is closed with a positive result.

After the end of the test, the motor controller restarts automatically and becomes operational again.

7.9.4 Test result and parameter file

Test result

The test result can be read out in bit 15 of object 6041_h. If this bit is set, the test was successful and closed loop mode is possible.

If the bit is deleted, closed loop mode is possible but the parameters are not optimal.

Parameters

The parameters that are determined during auto setup are stored in the file `fs/config/startup/tuning.on` and are transferred to the following objects of the object directory with every restart.

Index	Subindex	Description	Remark
2030 _h	00 _h	Pole pair count	E.g. 50 (equivalent to 200 poles)
2050 _h	00 _h	Encoder alignment	Between 0 and 65535
2051 _h	01 _h	Frequency of the encoder correction	
2051 _h	02 _h	Amplitude of the encoder correction	
2051 _h	03 _h	Shifting of the encoder correction	
2051 _h	01 _h	Physical encoder resolution	e.g. 2000
2051 _h	02 _h	Index polarity	0 = normal, 1 = inverted
2051 _h	03 _h	Index width	Internal operand or FFFFFFFF _h (-1) to switch off the encoder monitoring.

8 General concepts

8.1 DS402 Power State machine

8.1.1 State machine

CANopen DS402

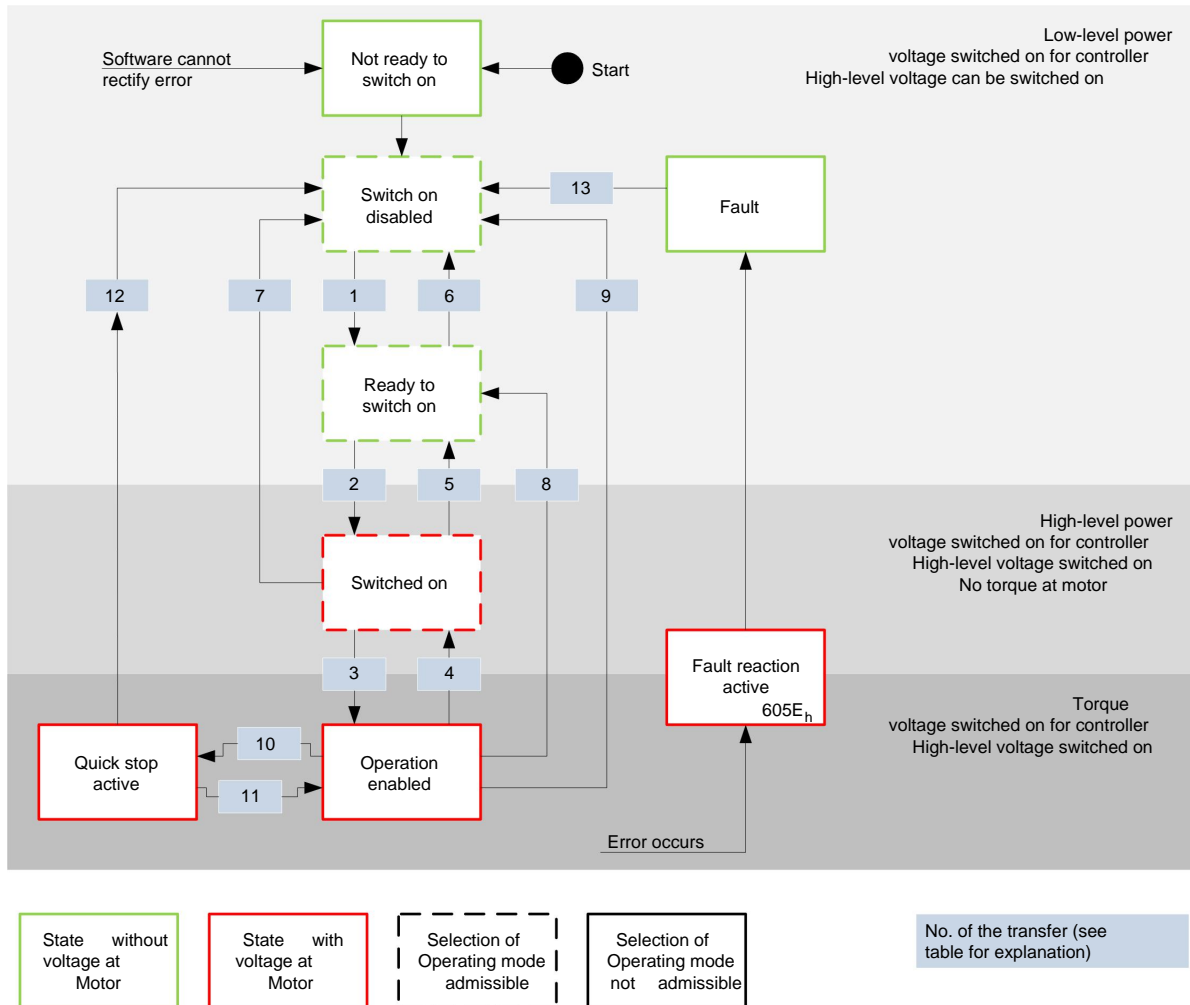

To switch the motor controller to an operational state, a state machine must be run through. This is defined in CANopen standard DS402. State changes are requested in object **6040_h** (control word). The actual state of the state machine can be read out from object **6041_h** (status word).

Control word

State changes are requested via object **6040_h** (control word). The following **table** lists the bit combinations that lead to the corresponding state transitions.

State transitions

The diagram shows the possible state transitions.

The following **table** lists the bit combinations for the control word that lead to the corresponding state transitions. An X corresponds to a bit state that is no longer to be considered. The single exception is the fault reset: The transition is only requested by the rising flank of the bit.

Command	Bit in object 6040 _h					Transition
	Bit 7	Bit 3	Bit 2	Bit 1	Bit 0	
Shutdown	0	X	1	1	0	1, 5, 8
Switch on	0	0	1	1	1	2
Disable voltage	0	X	X	0	X	6, 7, 9, 12
Quick stop	0	X	0	1	X	10
Disable operation	0	0	1	1	1	4
Enable operation	0	1	1	1	1	3, 11
Fault reset		X	X	X	X	13

Status word

The following table lists the bit masks that describe the state of the motor controller.

Status word (6041 _h)	State
xxxx xxxx x0xx 0000	Not ready to switch on
xxxx xxxx x1xx 0000	Switch on disabled
xxxx xxxx x01x 0001	Ready to switch on
xxxx xxxx x01x 0011	Switched on
xxxx xxxx x01x 0111	Operation enabled
xxxx xxxx x00x 0111	Quick stop active
xxxx xxxx x0xx 1111	Fault reaction active
xxxx xxxx x0xx 1000	Fault

The motor controller reaches the "Switch on" state after it is switched on and the self-test is successful.

Operating mode

The set operating mode (6060_h) becomes active in the "Operation enabled" state. The operating mode can only be set or changed in the following states (see states enclosed by a dashed line in the diagram):

- Switch on disabled
- Ready to switch on
- Switched on

During operation ("Operation enabled"), it is not possible to change the operating mode. The "Fault" state is left when bit 7 in object 6040_h (control word) is set from "0" to "1" (rising flank).

Note: If an error that cannot be corrected occurs, the motor controller changes to the "Not ready to switch on" state and stays there. These errors include:

- Encoder error (e.g. due to missing shielding, cable breakage)

This state can also be reached through a bus error with the EtherCAT field bus type. In this case, the system automatically changes back to the "Switch on disabled" state after the bus error is eliminated.

8.1.2 Behavior after the "Operation enabled" state is left

Brake reactions

Different brake reactions can be programmed when leaving the "Operation enabled" state.

These include the transitions described below.

The following diagram shows an overview of the brake reactions.

Quick stop active

Transition to the "Quick stop active" state (quick stop option):

In this case, the action stored in object **605A_h** is executed (see the following table).

Value in object 605A_h	Description
-32768 to -1	Reserved
0	Immediate stop with short-circuit braking
1	Braking with "slow down ramp" (deceleration depending on operating mode) and subsequent state change to "Switch on disabled"
2	Braking with "quick stop ramp" and subsequent state change to "Switch on disabled"
3 to 32767	Reserved

Ready to switch on

Transition to the "Ready to switch on" state (shutdown option):

In this case, the action stored in object **605B_h** is executed (see the following table).

Value in object 605B _h	Description
-32768 to -1	Reserved
0	Immediate stop with short-circuit braking
1	Braking with "slow down ramp" (deceleration depending on operating mode) and subsequent state change to "Switch on disabled"
2 to 32767	Reserved

Switched on

Transition to the "Switched on" state (disable operation option):

In this case, the action stored in object 605C_h is executed (see the following table).

Value in object 605C _h	Description
-32768 to -1	Reserved
0	Immediate stop with short-circuit braking
1	Braking with "slow down ramp" (deceleration depending on operating mode) and subsequent state change to "Switch on disabled"
2 to 32767	Reserved

Stop

Stop:

When bit 8 is set in object 6040_h (control word), the response stored in 605D_h is executed in velocity mode and profile velocity mode (see the following table).

Value in object 605D _h	Description
-32768 to 0	Reserved
1	Braking with "slow down ramp" (deceleration depending on operating mode)
2	Braking with "quick stop ramp" (deceleration depending on operating mode)
3 to 32767	Reserved

Fault

Fault:

If an error should occur, the motor is braked as stored in object 605E_h.

Value in object 605E _h	Description
-32768 to -1	Reserved
0	Immediate stop with short-circuit braking
1	Braking with "slow down ramp" (deceleration depending on operating mode)
2	Braking with "quick stop ramp" (deceleration depending on operating mode)
3 to 32767	Reserved

8.2 User-defined units

8.2.1 Overview

Settings

The motor controller supports the possibility of setting user-defined units. In this way, the corresponding parameters can be set and read out directly in degrees, mm, etc.

Pole pair count compensation

Differences in the pole pair counts of motors can be compensated. For this purpose, the value in object **2060_h** must be set to "1". Then the pole pair count automatically enters the subsequent computation so that different motors can be operated on the motor controller without requiring a new configuration.

8.2.2 Computation formulas for user units

Gear ratio

The gear ratio is calculated from the motor revolutions (**6091_{h:1}** (Motor Revolutions)) per shaft revolution (**6091_{h:2}** (Shaft Revolutions)) as follows:

$$\text{Gear ratio} = \frac{\text{Motor revolution (6091}_{h:1})}{\text{Shaft revolution (6091}_{h:2})}$$

If object **6091_{h:1}** or object **6091_{h:2}** are set to "0", the firmware sets the value to "1".

Feed constant

The feed constant is calculated from the feed (**6092_{h:1}** (Feed Constant)) per revolution of the drive axis (**6092_{h:2}** (Shaft Revolutions)) as follows:

$$\text{Feed rate} = \frac{\text{Feed (6092}_{h:1})}{\text{Revolution of the drive axis (6092}_{h:2})}$$

This is useful to indicate the spindle pitch of a linear axis.

If object **6092_{h:1}** or object **6092_{h:2}** are set to "0", the firmware sets the value to "1".

Position

The current position in user units (**6064_h**) is calculated as follows:

$$\text{Actual position} = \frac{\text{Internal position} \times \text{feed rate}}{\text{Encoder resolution} \times \text{gear ratio}}$$

Speed

The speed specifications of the following objects can likewise be specified in user units:

Object	Mode	Meaning
606B_h	Profile Velocity Mode	Output value of ramp generator
60FF_h	Profile Velocity Mode	Speed specification
6099_h	Homing mode	Speed for searching the index/switch
6081_h	Profile Position Mode	Target speed
6082_h	Profile Position Mode	End speed

The internal speed in mechanical revolutions per second is multiplied by a factor for numerator (**2061_h**) and denominator (**2062_h**). The speed in user units is computed from

$$\text{Speed} = \frac{\text{Internal speed x numerator factor (2061}_h)}{\text{Denominator factor (2062}_h)}$$

If object **2061_h** or **2062_h** is to be set to "0", the firmware sets the value to "1".

Acceleration

The acceleration can also be output in user units:

Object	Mode	Meaning
609A_h	Homing mode	Acceleration
6083_h	Profile Position Mode	Acceleration
6084_h	Profile Position Mode	Deceleration
60C5_h	Profile Velocity Mode	Acceleration
60C6_h	Profile Position Mode	Deceleration
6085_h	"Quick stop active" state (DS402 Power State machine)	Deceleration

The internal acceleration in mechanical revolutions per second squared is multiplied by a factor consisting of a numerator (**2063_h**) and denominator (**2064_h**).

$$\text{Acceleration} = \frac{\text{Internal acceleration x numerator factor (2063}_h)}{\text{Denominator factor (2064}_h)}$$

If object **2063_h** or **2064_h** is to be set to "0", the firmware sets the value to "1".

Jerk

For the jerk, objects **604A_h:1_h** to **604A_h:4_h** can be specified in user units. These objects only affect the Profile Position Mode and Profile Velocity Mode.

The objects **2065_h** for the numerator and **2066_h** for the denominator are available. The values of objects **604A_h:1_h** to **4_h** are computed from the mechanical revolutions per second to the power of three multiplied by a numerator and denominator:

$$\text{Jerk} = \frac{\text{Internal value x numerator factor (2065}_h)}{\text{Denominator factor (2066}_h)}$$

If object **2065_h** or **2066_h** is to be set to "0", the firmware sets the value to "1".

Positional data

All positional values in the open loop and closed loop mode are specified in the resolution of the virtual position encoder. This is calculated from the encoder cycles (**608F_h:1_h** (Encoder Increments)) per motor revolutions (**608F_h:2_h** (Motor Revolutions)) multiplied by the polarity of the axis in object **607E_h** bit 0. If bit 0 in object **607E_h** is set to the value "1", this corresponds to a polarity reversal, or the value "-1" in the formula:

$$\text{Resolution of the position encoder} = \text{polarity (607E}_h \text{ Bit 0)} \times \frac{\text{Encoder cycles (608F}_h:1)}{\text{Motor revolutions (608F}_h:2)}$$

If the value of **608F_h:1_h** or **608F_h:2_h** are set to "0", the motor controller continues computing internally with a "1". The factory settings are:

- Encoder increments **608F_h:1_h** = "2000"
- Motor revolutions **608F_h:2_h** = "1"
- Polarity **607E_h** bit 0 = "0" (does not correspond to a polarity reversal)

The resolution of the connected position encoder is set in object **2052_h**.

9 Special functions

9.1 Digital inputs and outputs

The motor controller has digital inputs and outputs.

9.1.1 Digital inputs

Two groups

The inputs are subdivided into two groups:

- Inputs 1 to 6 are designed for voltages of 0 V to 24 V with the switching thresholds at 11 V (on) and 9.5 V (off)
- Inputs 7 and 8 are wide-range inputs for voltages 0 V to 5 V – 24 V. The switching thresholds are at 3.0 V (on) and 2.5 V (off).

The state of an input is stored in entry **60FD_h** as a bit value. Each input is assigned a bit position: Input 1 corresponds to bit 16 of object **60FD_h**, input 2 corresponds to bit 17 of object **60FD_h**, etc. (see the following table).

The inputs are evaluated every millisecond; reactions to changes to the inputs can occur in <2 ms.

Object 60FD _h	Input / special function
Bit 0	Negative limit switch
Bit 1	Positive limit switch
Bit 2	Reference switch
Bit 3	Clock input
Bit 4	Directional input
Bit 16	Input 1
Bit 17	Input 2
Bit 18	Input 3
Bit 19	Input 4
Bit 20	Input 5
Bit 21	Input 6
Bit 22	Input 7
Bit 23	Input 8

Object entries

The following OD settings can be used to manipulate the value of an input, in which case only the bit that corresponds to that input will have an effect:

- **3240_h:01_h**

This bit is used to switch the special functions of an input on (value "0") or off (value "1"). If input 1 is not to be used as a negative limit switch, for example, the special function must be switched off so that the signal encoder is not erroneously responded to. The object has no effects on bits 16 to 31.

The firmware evaluates the following bits during a reference run (homing method):

- Bit 0: negative limit switch
 - Bit 1: positive limit switch
 - Bit 2: reference switch
- **3240_h:02_h**

This bit changes from closer logic (a logical high level at the input yields the value of "1" in object **60FD_h**) to opener logic (the logical high level at the input yields the value of "0"). This applies to the special functions (except the clock and directional inputs) and for the normal input. The input is set as closer logic if the corresponding bit is "0", it is set to opener logic with the value "1" respectively.

- **3240_h:03_h**

This bit switches on software simulation of the input values when it is set to "1". In this case, the actual values are no longer used; the values set in object **3240_h:04_h** for the respective input are used instead.

- **3240_h:04_h**

This bit specifies the value to be read in as the input value if the same bit was set in object **3240_h:03_h**.

- **3240_h:05_h**

This object contains the unmodified input value.

Computation of the inputs

Computation of the input using input 1 as an example:

The value of bit 0 of object **60FD_h** is interpreted by the firmware as a negative limitation switch, and the result of the complete computation is stored in bit 16.

9.1.2 Digital outputs

Outputs

The outputs are controlled using object **60FE_h**. Output 1 corresponds to bit 16 in object **60FE_h**, output 2 corresponds to bit 17, etc., as with the inputs. The outputs with special functions are again entered in the firmware in the lower bits 0 to 15. Currently only bit 0 is assigned that controls the motor brake.

Object entries

Additional OD entries exist for manipulating the value of the outputs (see the following example for details). Similar to the inputs, only the bit at the corresponding position always has an effect on the respective output:

- **3250_h:02_h**

This can be used to change the logic from "closer" to "opener". When configured as a "closer", the outputs a logical high level if the bit is "1". When configured as an "opener", the outputs a logical low level if there is a "1" in object **60FE_h**.

- **3250_h:03_h**

If a bit is set in **3250_h**, the output is manually controlled. The value for the output is then contained in object **3250_h:04_h**, which is also possible for the brake output.

- **3250_h:04_h**

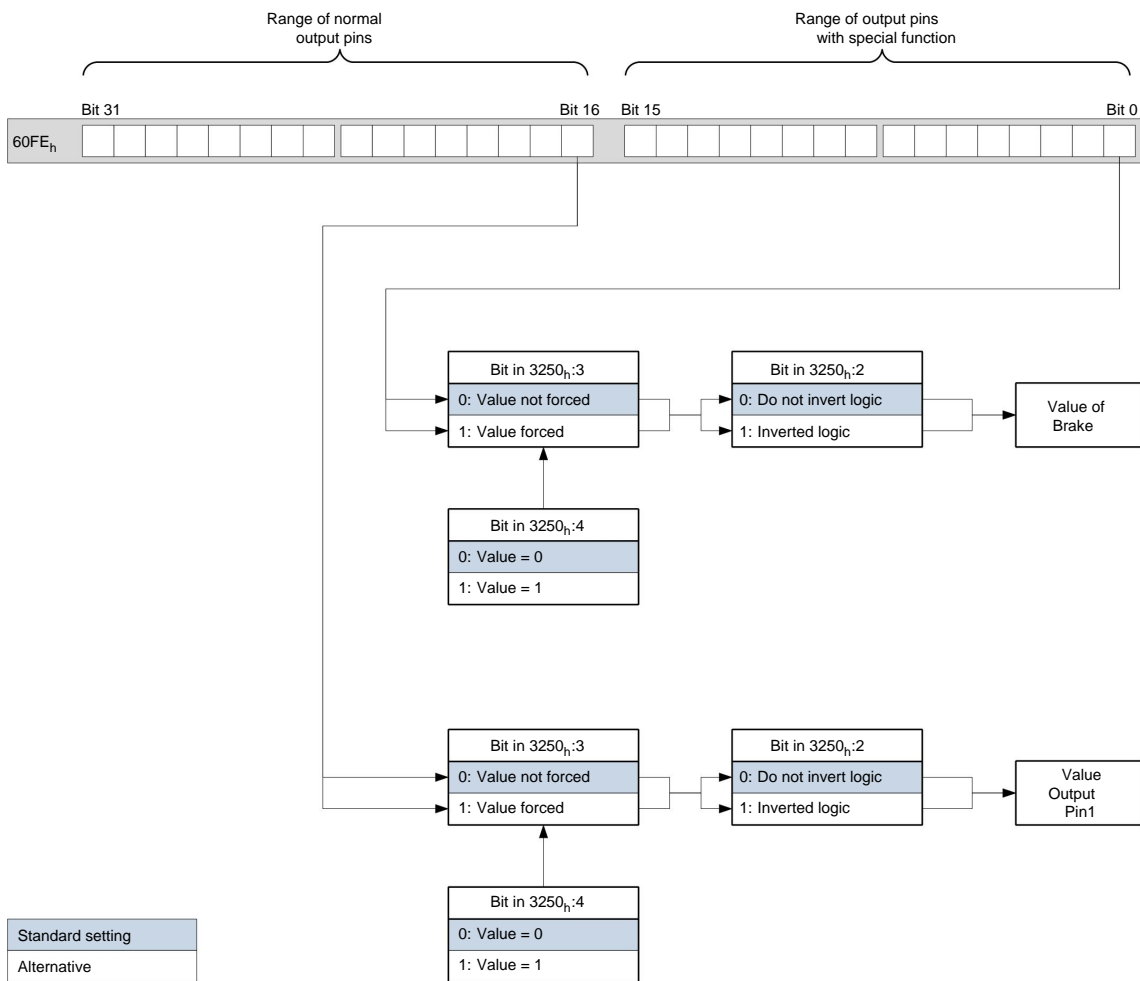

The bits in this object specify the output value that is to be applied to the output when the manual control of the output is activated by object **3250_h:03_h**.

- **3250_h:05_h**

This object does not have any function and is included for compatibility reasons.

Bits of the outputs

Example of the computation of the bits for the outputs:

9.2 Automatic brake controller

9.2.1 Description

The current switch-off and brake control are active when the motor is stationary for an extended period or is to be accelerated from a standstill. These functions are not supported by the synchronous operating modes. Apart from this, they are always available, independent of the set operating mode (**6060_h**).

The brake output of the motor controller results in a PWM signal whose frequency and duty cycle can be set.

The brake output is located at connector X4 (see also the "**Brake output (connector X4)**" section).

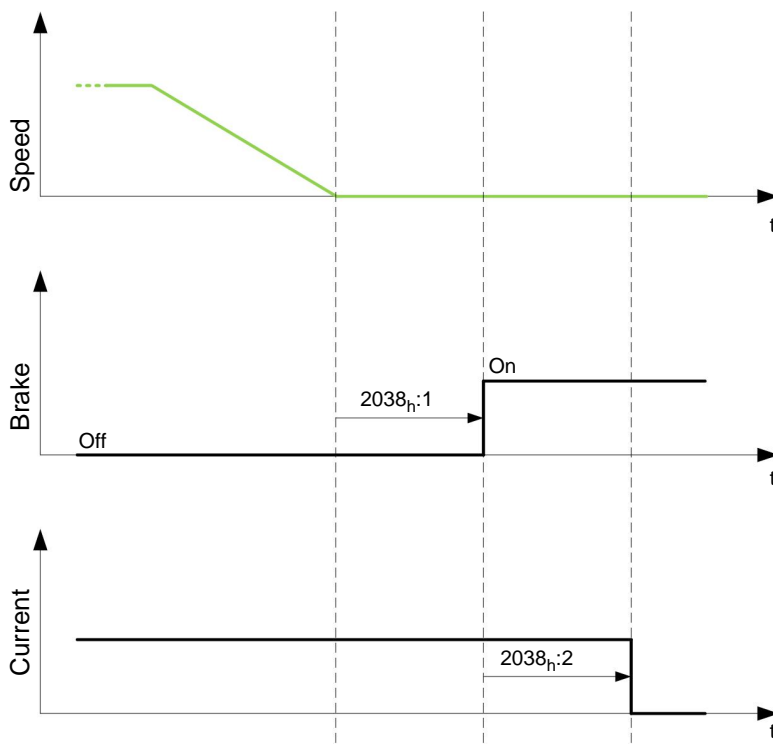

9.2.2 Activation and connection

The brake control can be controlled with bit 2 of object **3202_h**. If the bit is set to "1", the brake controller is activated; if set to "0", the motor controller will not use the brake. The brake can also be manually controlled via bit 0 in **60FE_h** and can be manipulated with the objects for the settings for the digital outputs (see "**Digital inputs and outputs**").

 CAUTION
When the brake is used manually, the firmware needs to be instructed not to use the brake control (3202_h bit 2 at "0")..

9.2.3 Braking the motor

When the motor comes to a standstill, the brake is activated after the time **2038_h:1_h** expires. After the time **2038_h:2_h** expires, the motor current is switched off.

9.2.4 Setting a new move command

After a new move command is issued, the current is switched on again immediately; the brake is disengaged after the wait period **2038_h:3_h** has expired. Then another period **2038_h:4_h** elapses before movement begins.

9.2.5 Brake PWM

The switched-on brake generates a PWM signal at the output of the motor controller whose duty cycle and frequency can be set. If an output pin without PWM is required, a duty cycle of 100 percent can be set.

Frequency

The frequency of the brake PWM can be set in object **2038_h:5_h**. The unit is hertz; a value greater than 2000 is not possible.

Duty cycle

The duty cycle – the relationship of the pulse duration to the period duration – is set in **2038_h:6_h**. The value is interpreted as a percentage and can be set between 1 and 100. At a value of 100, the output pin is switched on permanently.

The figure below shows an example of duty cycles of 25 and 50 percent with the same frequency.

9.3 I²t motor overload protection

9.3.1 Description

I²t motor overload protection has the goal of preventing damage to the motor and of simultaneously operating it normally at its thermal limit.

The function is only available when the motor controller is in closed loop operating mode (bit 0 of object **3202_h** set to "1") and the motor is **not** in profile torque mode or cycle synchronous torque mode.

There is a single exception: If I²t is activated open loop mode, the current is limited to the set nominal current even when the set maximum current is greater. This feature was implemented for safety reasons, so that it is also possible to switch out of closed loop mode and into open loop mode with a very high short-time maximum current without damaging the motor.

9.3.2 Object entries

The following objects affect I²t motor overload protection:

- **2031_h**: Peak Current - specifies the maximum current in mA.
- **203B_h:1_h** Nominal Current - specifies the nominal current in mA.
- **203B_h:2_h** Maximum Duration Of Peak Current - specifies the maximum time period of the maximum current in ms.

The following objects indicate the actual state of I²t:

- **203B_h:3_h** Threshold - specifies the limit in mA, from which is determined whether switching is to the maximum current or nominal current.
- **203B_h:4_h** CalcValue - specifies the calculated value that is compared to the threshold in order to set the current.
- **203B_h:5_h** LimitedCurrent - shows the actual current value that was set by I²t.
- **203B_h:6_h** Status:
 - Value = "0": I²t deactivated
 - Value = "1": I²t activated

9.3.3 Activation

The three object entries above must have been appropriately specified to activate the mode. This means that the maximum current must be greater than the nominal current, and a time value must be entered for the maximum time of the maximum current. I²t operability remains deactivated when these conditions are not satisfied.

9.3.4 Function of I^2t

A I^2T_{Lim} is calculated by specifying the nominal current, maximum current, and maximum time period for the maximum current.

The motor can run with maximum current until the calculated I^2T_{Lim} is reached. The current is then immediately reduced to the nominal current.

The following diagram again shows the interactions.

In the first section t_1 , the current value is higher than the nominal current. At time t_{1Lim} , I^2t_{Lim} is reached and the current is limited to the nominal current. During the following time period t_2 , a current comes that corresponds to the maximum current. Accordingly, the value for I^2t_{Lim} is reached faster than in time period t_1 .

9.4 Save Objects

CAUTION

The incorrect use of this feature may cause the controller not be able to start again. Therefore read the chapter completely before using this feature.

9.4.1 General information

A subset of objects can be stored and will get loaded automatically with the next start. Moreover the values will be kept during a firmware update.

Only whole sets of objects (called "categories") can be stored, it is not possible to store single objects.

An object belongs to one of the following categories:

1. The object is not savable.
2. The object is related to the communication (e.g. fieldbus) so it belongs to the category "communication".
3. The object holds general user information so it belongs to the category "user"

In chapter " **Object directory description**" - with the list of all objects - the ability to get saved is described for each object.

9.4.2 Category: not savable

The not savable objects are ignored in the process of saving. All status and control words and all objects depending on the status of the controller are ranked among this category.

9.4.3 Category: communication objects

All objects controlling the fieldbus are ranked among this category.

The following objects are considered to be a communication object:

- **1005_h**: COB-ID Sync
- **1007_h**: Synchronous Window Length
- **100C_h**: Guard Time
- **100D_h**: Live Time Factor
- **1014_h**: COB-ID EMCY
- **1017_h**: Producer Heartbeat Time
- **1400_h**: Receive PDO 1 Communication Parameter
- **1401_h**: Receive PDO 2 Communication Parameter
- **1402_h**: Receive PDO 3 Communication Parameter
- **1403_h**: Receive PDO 4 Communication Parameter
- **1600_h**: Receive PDO 1 Mapping Parameter
- **1601_h**: Receive PDO 2 Mapping Parameter
- **1602_h**: Receive PDO 3 Mapping Parameter
- **1603_h**: Receive PDO 4 Mapping Parameter
- **1800_h**: Transmit PDO 1 Communication Parameter
- **1801_h**: Transmit PDO 2 Communication Parameter
- **1802_h**: Transmit PDO 3 Communication Parameter
- **1803_h**: Transmit PDO 4 Communication Parameter
- **1A00_h**: Transmit PDO 1 Mapping Parameter
- **1A01_h**: Transmit PDO 2 Mapping Parameter
- **1A02_h**: Transmit PDO 3 Mapping Parameter
- **1A03_h**: Transmit PDO 4 Mapping Parameter
- **2005_h**: CANopen Baudrate
- **2009_h**: CANopen NodeID
- **2010_h**: IP-Configuration
- **2011_h**: Static-IP-Address
- **2012_h**: Static-IP-Subnet-Mask

9.4.4 Category: user object

The following objects are considered to be a user object:

- **2031_h**: Peak Current
- **2032_h**: Maximum Speed
- **2033_h**: Plunger Block
- **2034_h**: Upper Voltage Warning Level
- **2035_h**: Lower Voltage Warning Level
- **2036_h**: Open Loop Current Reduction Idle Time
- **2037_h**: Open Loop Current Reduction Value/factor
- **2038_h**: Brake Controller Timing
- **2056_h**: Limit Switch Tolerance Band
- **2057_h**: Clock Direction Multiplier
- **2058_h**: Clock Direction Divider
- **2059_h**: Encoder Configuration
- **2060_h**: Compensate Polepair Count
- **2061_h**: Velocity Numerator

- **2062_h**: Velocity Denominator
- **2063_h**: Acceleration Numerator
- **2064_h**: Acceleration Denominator
- **2065_h**: Jerk Numerator
- **2066_h**: Jerk Denominator
- **2084_h**: Bootup Delay
- **2300_h**: NanoJ Control
- **2303_h**: Number Of Active User Program
- **2304_h**: Table Of Available User Programs
- **2310_h**: NanoJ Input Data Selection
- **2320_h**: NanoJ Output Data Selection
- **2330_h**: NanoJ In/output Data Selection
- **3202_h**: Motor Drive Submode Select
- **320A_h**: Motor Drive Sensor Display Open Loop
- **320B_h**: Motor Drive Sensor Display Closed Loop
- **3210_h**: Motor Drive Parameter Set
- **3221_h**: Analogue Inputs Control
- **3240_h**: Digital Inputs Control
- **3250_h**: Digital Outputs Control
- **3321_h**: Analogue Input Offset
- **3322_h**: Analogue Input Pre-scaling
- **3700_h**: Following Error Option Code
- **6046_h**: VI Velocity Min Max Amount
- **6048_h**: VI Velocity Acceleration
- **6049_h**: VI Velocity Deceleration
- **604A_h**: VI Velocity Quick Stop
- **604C_h**: VI Dimension Factor
- **605A_h**: Quick Stop Option Code
- **605B_h**: Shutdown Option Code
- **605C_h**: Disable Option Code
- **605D_h**: Halt Option Code
- **605E_h**: Fault Option Code
- **6072_h**: Max Torque
- **607B_h**: Position Range Limit
- **607C_h**: Home Offset
- **607D_h**: Software Position Limit
- **607E_h**: Polarity
- **6081_h**: Profile Velocity
- **6082_h**: End Velocity
- **6083_h**: Profile Acceleration
- **6084_h**: Profile Deceleration
- **6085_h**: Quick Stop Deceleration
- **6086_h**: Motion Profile Type
- **6087_h**: Torque Slope
- **608F_h**: Position Encoder Resolution
- **6091_h**: Gear Ratio
- **6092_h**: Feed Constant
- **6098_h**: Homing Method
- **6099_h**: Homing Speed
- **609A_h**: Homing Acceleration
- **60A4_h**: Profile Jerk
- **60C2_h**: Interpolation Time Period
- **60C5_h**: Max Acceleration

- **60C6_h**: Max Deceleration

9.4.5 Starting save process

 CAUTION	
<ul style="list-style-type: none"> • The motor has to stand still during the process of saving and is not allowed to get approached while saving. • While saving the function of the fieldbus may be affected. • The process of saving may need – depending on the type of controller – up to ten seconds. Never disconnect the power supply during this period. The nonobservance may led to an broken file system, as a result the controller gets unusable. • Therefore always wait for the controller to signal the successful process of saving with the value "1" in the correspondent subindex in object 1010_h. 	

For each category there is a subindex in object **1010_h**. The only thing to do to save all objects of that category is to write the value 65766173_{16} ¹ to the subindex. The end of the save process will be signalled by the controller by writing the value "1" to the subindex.

The following table lists, which subentry of the object **1010_h** is related to which category.

Subindex	Category
01 _h	all categories
02 _h	communication

9.4.6 Drop saved values

 CAUTION	
After deleting the saved values the controller will reboot.	

To drop all saved values of all categories at once the value $64616F6C_{16}$ needs to be written to the object **1011_h:01_h**². Thereupon all saved values will get deleted, thus the controller is resetted to factory default. The controller will reboot after deleting all values.

¹ This corresponds to decimal 1702257011_{10} or the ASCII string " save"

² This corresponds to decimal 1684107116_{10} or the ASCII string " load"

10 Programming with NanoJ

10.1 Introduction

The VMM (Virtual Machine Monitor) is a protected execution environment within the firmware. The user can load his or her own programs ("User Program") in this environment via the web interface. These can trigger functions in the motor controller, for example by reading or writing entries in the object directory.

The use of protective mechanisms makes it impossible for the user programs to cause the actual firmware to crash. In the worst case, the user program alone is aborted with an error code stored in the object directory.

10.2 Available computing time

A user program receives computing time in a 1-ms cycle (see also the following diagram). Because the firmware loses computing time due to interrupts and system functions, only about 30% - 50% of this time is available to the user program (depending on the operating mode and application case). During this time, the user program must have completed its operations and must either have closed or have yielded the computing time with the `yield()` function. In the first case, the user program is started again when the next 1-ms cycle begins; in the second case, the program is continued at the command following the `yield()` in the next 1-ms cycle.

If the system detects that the user program requires more than the time assigned to it, it is closed and an error code is entered in the object directory. When developing user programs, therefore, the runtime behavior of the program must be carefully checked, especially in the case of time-intensive tasks. Therefore, it is advisable to use tables, instead of calculating a sinus value from a `sin` function.

Note

If the NanoJ program should not return the computing time for an excessive time, it is ended by the operating system. In this case, the number "4" is entered in the status word at object **2301_h** of the VMM; the number "5" (timeout) is noted in the VMM error register at object **2302_h**.

10.3 Sandbox

10.3.1 Introduction

The MPU (Memory Protection Unit) of Cortex-M3 and the Privileged Mode and User Mode are used to create a sandbox. This means that a user program running in this sandbox can only access the specially assigned memory areas and system resources. For example, the attempt to write directly to

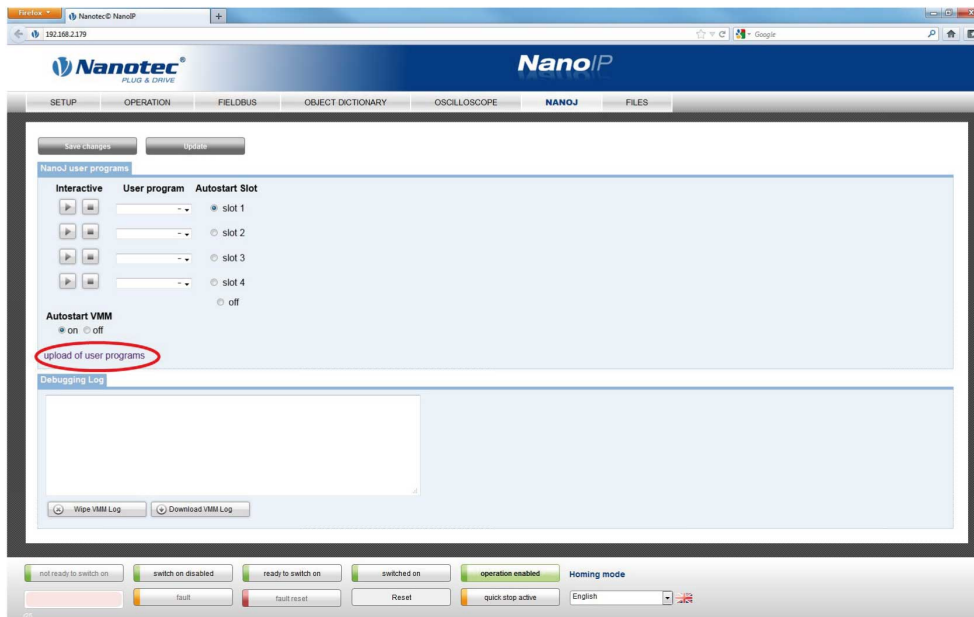

a processor IO register is acknowledged with an MPU fault and the user program is closed with the corresponding error code in the OD.

10.4 Loading a NanoJ program

10.4.1 Uploading a NanoJ program

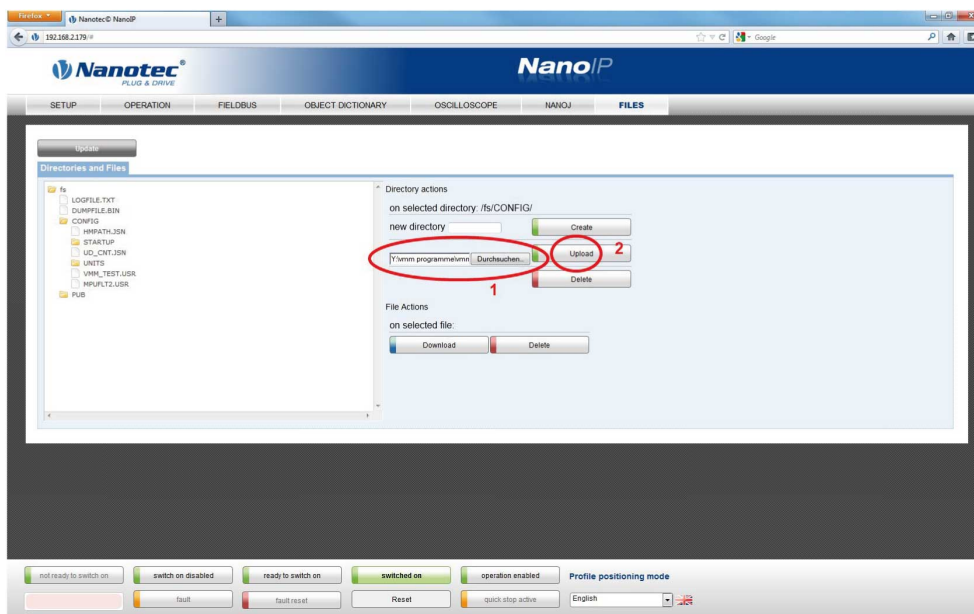

A user program created with NanoJ Easy can be uploaded on the web interface.

1. You do this by clicking on the "NANOJ" tab and then clicking on "upload of user programs":

The interface then changes to the file manager.

2. Use the "Search" button to select the user program stored on the PC. It must have the extension .USR.
3. Click on "Upload". The user program is loaded into the "Config" directory.

4. Switch back to the VMM control page by clicking on the "NANOJ" tab.
5. Click on "Update" and select the user program in one of the corresponding selection fields.
6. Save this change with "Save changes".

10.4.2 Preselection of user programs

The configuration page enables the preselection of up to 4 user programs. The desired program can be started or stopped using the play/stop buttons familiar from audio devices:

A started and running program is shown in green on the interface. If a user program causes an fault and is closed, it is highlighted in red.

If a user program is to start running automatically as soon as the motor controller is switched on, this can be set in the "Autostart Slot".

In the "Debugging Log" text field, variables and texts for debugging the program can be output by opening a special system call. See also "**System calls**".

10.5 Interaction of the user program with the motor controller

10.5.1 Communication options

A user program has numerous options for communicating with the motor controller:

- Reading and writing of OD values per PDO mapping
- Direct reading and writing of OD values via system calls
- Calling up of other system calls (e.g. write debug output)

Via a PDO mapping, OD values in the form of variables are made available to the user program. Before a user program receives its 1-ms time slot, the firmware transfer the values for this from the OD to the variables of the user program. When the user program now receives computing time, it can manipulate these variables like the usual C variables. At the end of the time slot, the new values are automatically copied into the respective OD entries by the firmware.

To optimize the performance, 3 types of mappings are defined: Input, output and input/output (In, Out, InOut). Input mappings can only be read and are not transferred back into the OD. Output mappings can only be written. Input/Output Mappings, on the other hand, permit reading and writing.

The set mappings can be read out and checked via the web interface at objects **2310_h**, **2320_h**, and **2330_h**. For each mapping, a maximum of 16 entries is allowed.

The specification of the linker section is used to control in NanoJ Easy whether a variable is stored the under input, output, or data range.

10.5.2 Execution of a VMM cycle

In summary, the procedure for the execution of a VMM cycle with respect to the PDO mapping consists of the following three steps:

1. Read values from the object directory and copy them into the Inputs and Outputs areas.
2. Execute the user program.
3. Copy values from the Outputs and Inputs areas back to the object directory.

The configuration of the copy procedures is in line with the CANopen standard.

In addition, it is also possible to access system calls via the object directory. In general, this is considerably slower and therefore mappings should be given preference. However, the number of mappings is limited (16 entries each in In/Out/InOut). Therefore, it is advisable to map frequently-used and changed OD values and to access less frequently used OD entries by system call. A list of available system calls can be found in the "**System calls**" section.

Note

It is strongly advised to access one single OD value **either** by mapping **or** system call with `od_write()`. If both are used at the same time, system call will not have any effect.

10.6 OD entries for controlling and configuring the VMM

10.6.1 OD entries

The VMM is controlled and configured by means of OD entries in the object range **2300_h** to **2330_h**. The web interface handles a large portion of the task, which is why it is usually not necessary for the user to directly access the entries.

OD Index	Name
2300_h	VMM Control (Read/write)
2301_h	VMM Status (Read only)
2302_h	VMM Error Code (Read only)
2303_h	Number Of Active User Program (Read/Write)
2304_h	Table of available user programs
2310_h	VMM Input Data Selection
2320_h	VMM Output Data Selection
2330_h	VMM In/output Data Selection

10.6.2 Example

To select and start the "TEST1.USR" user program, the following sequence can be used for instance:

- Upload the program file into the "config" directory via the Ethernet connection
- Write the value "54453554_h" in object **2304_h:01_h**.
- Write the value "31000000_h" in object **2304_h:02_h**.
- Write the value "1_h" in object **2303_h**.

- Check the entry **2302_h** for error codes.
 - If no error:
 - Launch the program by writing object **2300_h**, bit 0 = "1".
 - Check the entry **2302_h** for error codes and the object **2301_h**, bit 0 = "1".
- To stop a running program: Write the bit 0-value = "0" to the entry **2300_h**.

10.7 NanoJ Easy V2

10.7.1 Installation and use

Introduction

As an alternative to NanoIP, a user program can also be programmed, uploaded, and controlled with the NanoJ Easy V2 software.

Installation

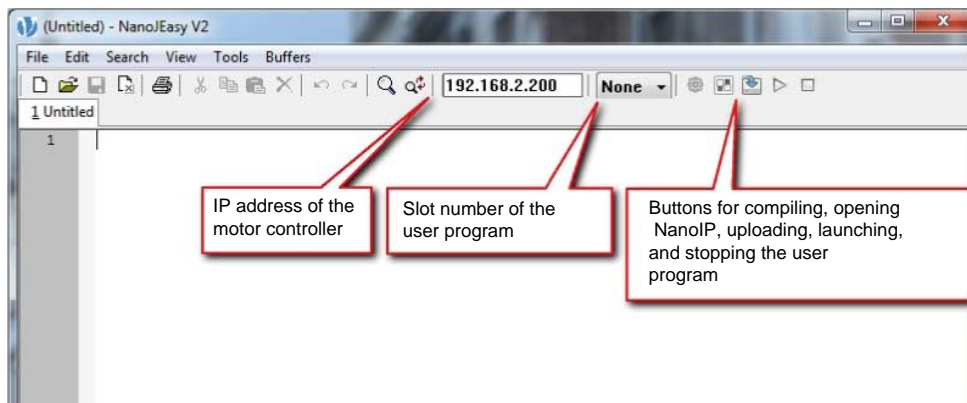

Proceed as follows for installation:

1. Unpack "NanoJEasyV2.zip" into a directory of your choice.
2. Launch the program with the file "NanoJEasy.exe".

Use

For all of the following actions, it is important that the IP address of the target motor controller is known. The IP address must be entered in the header line of NanoJ Easy V2, as shown in the following figure.

Before uploading the program, it is also necessary to select a slot on the target motor controller in which the user program is to run.

10.7.2 Programming of user programs

User program structure

A user program consists of at least two instructions:

1. The `#include "wrapper.h"` preprocessor instruction
2. The `void user() {}` function

The code to be executed can then be stored in the `void user()` function.

The file names of the user programs must not be longer than eight characters and contains three characters in the extension; for example, "main.cpp" is admissible while "alongerfilename.cpp" is not.

Example

Programming a square wave signal in the object **2500_h:01_h**

1. Copy the following text to the NanoJ Easy editor and store this file under the name "main.cpp".

```
// file main.cpp
map S32 outputReg1 as inout 0x2500:1

#include "wrapper.h"

// user program
void user() {
    U16 counter = 0;
    while( 1 ) {
        ++counter;
        if( counter < 100 )
            InOut.outputReg1 = 0;
        else if( counter < 200 )
            InOut.outputReg1 = 1;
        else
            counter = 0;
        // yield() 5 times (delay 5ms)
        for(U08 i = 0; i < 5; ++i )
            yield();
    }
} // eof
```

2. When the program has been properly translated:

Select any slot as the target slot.

3. Load the program onto the motor controller with the "Upload User Program" button.

The output if the transmission was successful is as follows:

```
mapvars v0.91 Mapping files successfully created. processing 0 Inputs:
processing 0 Outputs: processing 1 In-/Outputs: 25000120 done >Exit
code: 0
```

If the IP address of your motor controller differs from the address in the header of NanoJ Easy, the following message is output after some time:

```
connect to server: Connection timed out (10060)
!!! Connection Error !!!
```

4. In this case, check whether the IP address is correct and that you have access to the motor controller via the Ethernet. You can use the "start NanoIP" function as an aid by clicking on the button.

This starts the standard Internet browser of the computer and the homepage of the entered IP address is opened.

If NanoIP is not displayed, this may have the following causes:

- The IP address is incorrect,
- the motor controller is not connected to Ethernet,
- the computer can not access the motor controller,
- the motor controller is possibly not energized.

5. After successful upload: Launch the user program with the "start" button.

6. End the user program with the "stop" button.

10.7.3 Structure of a mapping

Introduction

This method can be used to directly link a variable in the NanoJ program with an entry in the object directory. The mapping must be created at the beginning of the file - before the `#include "wrapper.h"` instruction. Only a comment above the mapping is allowed.

Tip Use mapping if you frequently need access to an object in the object directory, such as the control word **6040_h** or status word **6041_h**.

The `od_write()` and `od_read()` functions are better suited for single access to objects (see the "**Access to the object directory**" section).

Declaration of the mapping

The declaration of the mapping is structured as follows:

```
map <TYPE> <NAME> as <input|output|inout> <INDEX>:<SUBINDEX>
```

The following applies:

- <TYPE>

The data type of the variable, i.e. U32, U16, U08, S32, S16 or S08.

- <NAME>

The name of the variable that is later used in the user program.

- <input|output|inout>

The write and read authorization of a variable: A variable can either be declared as input, output, or inout. This defines whether a variable is readable (input), writable (output) or both (inout) and the structure by which it needs to be addressed in the program.

- <INDEX>:<SUBINDEX>

Index and subindex of the object being mapped in the object directory.

Every declared variable is addressed in the user program via one of the three structures "In", "Out", or "InOut", depending on the defined write and read direction.

Example of a mapping

Example of a mapping and the associated variable access methods:

```
map U16 controlWord as output 0x6040:00
map U08 statusWord as input 0x6041:00
map U08 modeOfOperation as inout 0x6060:00

#include "wrapper.h"
void user() {
    [...]
    Out.controlWord = 1;
    U08 tmpVar = In.statusword;
```

```
InOut.modeOfOperation = tmpVar; [...]  
}
```

Potential error source

A potential source of error is a write access by means of the `od_write()` function on an object in the object directory that was also created as a mapping. The code shown below is **faulty**:

```
map U16 controlWord as output 0x6040:00  
#include " wrapper.h"  
void user() {  
  [...]  
  Out.controlWord = 1;  
  [...]  
  // the value is overwritten by the mapping  
  od_write(0x6040, 0x00, 5 );  
  [...]  
}
```

The line with the command `od_write(0x6040, 0x00, 5);` is without effect. As described in the introduction, all mappings are copied into the object directory at the end of each millisecond.

The following procedure is therefore derived:

- The function `od_write` writes the value "5" in object **6040_h:00_h**.
- At the end of the 1-ms cycle, the mapping is written that also specifies object **6040_h:00_h**, though with the value "1".
- This means - from the user's perspective - the `od_write` command is without effect.

10.8 System calls

10.8.1 Introduction

With system calls, it is possible to call up functions integrated in the firmware directly in a user program. Because a direct code execution is only possible in the protected area of the sandbox, this is implemented via so-called Cortex-Supervisor-Calls (Svc Calls). An interrupt is triggered when the function is called and the firmware thus has the possibility of temporarily allowing a code execution outside of the sandbox. Developers of user programs do not need to worry about this mechanism. For them, the system calls can be called up like normal C functions. Only the "wrapper.h" file must be integrated as usual.

10.8.2 Access to the object directory

- void **od_write**(U32 index, U32 subindex, U32 value)

This function writes the transferred value to the specified point in the object directory.

index	Index of the object being written in the object directory
subindex	Subindex of the object being written in the object directory
value	Value to be written

Note

It is strongly advised, to generate processor time with `yield()` after a `od_write()` has been called up. The value is immediately written to the OD. However, to enable the firmware to trigger dependent actions, it must receive computing time and therefore the user program must have been ended or stopped with `yield()`.

- void **od_read**(U32 index, U32 subindex)

This function reads the value at the specified point in the object directory and returns it.

index	Index of the object being read in the object directory
subindex	Subindex of the object being read in the object directory
Return value	Content of the OD entry

Note

Active waiting for a value in the object directory should always be associated with a `yield()`.

Example:

```
while (od_read(2400,2) != 0) // wait until 2400:2 is set
    yield();
```

10.8.3 Process control

- void **yield**()

This function returns the process time to the operating system. The program is resumed in the next time slot at the same location.

- void **sleep**(U32 ms)

This function returns the process time to the operating system for the specified number of milliseconds. The user program is then continued at the location following the call.

ms	Wait time in milliseconds
----	---------------------------

10.8.4 Debug output

The following functions output a value in the debug console. They differ only in the data type of the parameter being output.

- bool **VmmDebugOutputString**(const char *outstring)
- bool **VmmDebugOutputInt**(const U32 val)
- bool **VmmDebugOutputByte**(const U08 val)
- bool **VmmDebugOutputHalfWord**(const U16 val)
- bool **VmmDebugOutputWord**(const U32 val)
- bool **VmmDebugOutputFloat**(const float val)

Note

The debug outputs are first written to a separate area of the OD and are read out from there by the web interface. This OD entry has the index **2600_h** and is 64 characters long. The subindex 0 always contains the number of characters already written.

If the buffer is full, `VmmDebugOutputxxx()` initially fails; execution of the user program is discontinued and it stops at the location of the debug output. The program is not resumed until the web interface has read out the buffer and reset the subindex 0; `VmmDebugOutputxxx()` returns to the user program.

Debug outputs therefore may only be used during the test phase in the development of a user program.

11 Object directory description

11.1 Overview

You can find a description of objects in this section of the manual.

Here you will find information on the following:

- Functions
- Object descriptions ("Index")
- Value descriptions ("Subindices")
- Descriptions of bits
- Description of the object

11.2 Structure of the object description

The description of object entries is always structured the same and normally consists of the following sections:

Function

This section briefly describes the function of the object directory.

Object description

This table gives detailed information on the data type, specified values, and suchlike. A detailed description can be found in the "**Object description**" section.

Value description

This table is only available for the "Array" or "Record" data type and gives detailed information on the subentries. A more detailed description of entries can be found in the "**Value description**" section.

Description

More precise information on the single bits in an entry is given here or any compositions are explained. A detailed description can be found in the "**Description**" section.

11.3 Object description

The object description consists of a table that contains the following entries:

Index

Designates the index of the object in hexadecimal notation.

Object Name

The name of the object.

Object Code

The type of object. This can be one of the following entries:

- VARIABLE: In this case the object consists of only one variable that is indexed with subindex 0.
- ARRAY: This objects always consist of one subindex 0 – which specifies the quantity of valid subentries – and the subentries themselves from index 1. The data type in an array never changes, which means that subentry 1 and all following entries always have the same data type.
- RECORD: These objects always consist of one subentry with subindex 0 – which specifies the quantity of valid subentries – and the subentries themselves from index 1. As opposed to

an ARRAY, the data type of subentries may vary, meaning, for example, that subentry 1 may have a different data type than subentry 2.

- **VISIBLE_STRING**: The object specifies a character string encoded in ASCII. These character strings are **not** terminated by a zero string.

Data type

The size and interpretation of the object are specified here. The following notation applies for the "VARIABLE" object code:

- Distinction is drawn between entries that are signed; this is designated with the prefix "SIGNED". The prefix "UNSIGNED" is used for unsigned entries.
- The size of the variable in bits is added to the prefix and can be either 8, 16 or 32.

Firmware Version

The firmware version is entered here from which the object is available.

Change history (ChangeLog)

Any changes to the object are noted here.

Additionally, there are the following table entries for the "VARIABLE" data type:

Access

The access restriction is entered here. The following restrictions are available:

- "Read/write": The object can be read and written
- "Read only": The object can only be read from the object directory. It is not possible to set a value.

PDO Mapping

Some bus systems, such as CANopen or EtherCAT, support PDO mapping. This table entry specifies whether the object may be inserted in a mapping, and in which. The following designations are possible:

- "no": The object may not be entered in any mapping.
- "TX-PDO": The object may in be entered in a RX mapping.
- "RX-PDO": The object may in be entered in a TX mapping.

Admissible Values

In some cases, it is only permitted to write specific values into the object. When this is the case, these values are listed here. The field remains empty when there is no restriction.

Specified Value

Some objects must be preassigned with values to bring the motor controller into a safe state at switch on. The value written into the object for the motor controller start is noted in this table entry.

11.4 Value description

Note

For reasons of clarity, some subentries have been summarized here when all the entries have the same name.

All data for subentries with subindex 1 or higher are listed in the table with the heading "Value description". The table contains the following entries:

Subindex

Number of the currently specified subentry.

Name

The name of the subentry.

Data type

The size and interpretation of the subentry are specified here. The following notation always applies:

- Distinction is drawn between entries that are signed; this is designated with the prefix "SIGNED". The prefix "UNSIGNED" is used for unsigned entries.
- The size of the variable in bits is added to the prefix and can be either 8, 16 or 32.

Access

The access restriction for the subentry is entered here. The following restrictions are available:

- "Read/write": The object can be read and written
- "Read only": The object can only be read from the object directory. It is not possible to set a value.

PDO Mapping

Some bus systems, such as CANopen or EtherCAT, support PDO mapping. This table entry specifies whether the subentry may be inserted in a mapping, and in which. The following designations are possible:

- "no": The object may not be entered in any mapping.
- "TX-PDO": The object may in be entered in a RX mapping.
- "RX-PDO": The object may in be entered in a TX mapping.

Admissible Values

In some cases, it is only permitted to write specific values into the subentry. When this is the case, these values are listed here. The field remains empty when there is no restriction.

Specified Value

Some objects must be preassigned with subentries to bring the motor controller into a safe state at switch on. The value written into the subentry for the motor controller start is noted in this table entry.

11.5 Description

This section can be available when use requires additional information. When single bits of an object or subentry have a different meaning, diagrams are used as shown in the following example.

Example: The object is 8-bits large, bit 0 and 1 separately have one function. Bits 2 and 3 have been combined into one function, the same applies for bits 4 to 7.

7	6	5	4	3	2	1	0
Example [4]				Example [2]		B	A

Example [4]

Description of bits 4 to including 7, these bits logically belong together. The 4 in square brackets specifies the number of associated bits. A list of possible values and their description is frequently attached at this position.

Example [2]

Description of bits 3 and 2, these bits logically belong together. The 2 in square brackets specifies the number of associated bits.

- Value 00_b: The description at this position applies when bit 2 and bit 3 are at "0".
- Value 01_b: The description at this position applies when bit 2 is at "0" and bit 3 at "1".
- Value 10_b: The description at this position applies when bit 2 is at "1" and bit 3 at "0".
- Value 11_b: The description at this position applies when bit 2 and bit 3 are at "1".

B

Description of bit B, there is no length information for a single bit.

A

Description of bit A, bits with a gray background remain unused.

1000h Device Type

Function

Describes the motor controller type.

Object description

Index	1000 _h
Object Name	Device Type
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	00040192 _h
Firmware Version	FIR-v1426
Change History	

Description

Motor Type[16]

Describes the supported motor type.

Device profile number[16]

Describes the supported CANopen standard.

Values:

0129_h (specified value): The DS402 standard is supported.

1001h Error Register

Function

Error register: In the event of an error, the corresponding error bit is set. It is automatically deleted when the error no longer exists.

Object description

Index	1001 _h
Object Name	Error Register
Object Code	VARIABLE
Data type	UNSIGNED8

Description

General operation

If a new error occurs, it is entered in subindex 1. The existing entries in the subindices 1 to 7 are shifted back by one. The error at subindex 7 is removed.

The number of errors that have occurred can be read from the object with subindex 0. When a "0" is written into this object, counting starts anew.

Bit description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Error Number [8]								Error Class[8]							
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Error Code[16]															

Error Number [8]

This allows the reason for the error to be fully narrowed down. The meaning of the number can be found in the following table.

Error number	Description
1	Input voltage too high
2	Output current too high
3	Input voltage too low
4	Field bus error
5	Motor rotating in wrong direction – despite activated block
6	CANopen only: NMT master is taking too long to send Nodeguarding request
7	Encoder error due to electrical fault or faulty hardware
8	Encoder error; index not found during auto setup
9	Error in AB track
10	Positive limit switch and tolerance zone overwritten
11	Negative limit switch and tolerance zone overwritten
12	Device temperature above 80 °C
13	The values of object 6065_h (Following Error Window) and object 6066_h (Following Error Time Out) have been exceeded, and a fault has been output. This fault must be activated with bit 7 in object 3202_h .

Error Class[8]

This byte is identical to object **1001_h**

Error Code[16]

The meaning of the two bytes can be seen in the following table.

Error Code	Description
1000 _h	General error
2310 _h	Voltage at output of motor controller too high
3210 _h	Overvoltage/undervoltage at motor controller input
3220 _h	Undervoltage at input of motor controller
4200 _h	Temperature error in motor controller
7305 _h	Incremental sensor 1 faulty
8000 _h	Field bus monitoring error
8130 _h	Only CANopen: Life guard error or heartbeat - error
8611 _h	Position monitoring error: Subsequent error too large
8612 _h	Position monitoring error: Reference limit

1005h COB-ID Sync

Function

It defines the CobId of the SYNC message for the SYNC protocol. The value must correspond to a 11-bit-long CobID and only becomes valid when the CANopen stack is reset.

This object is only present in device variants with a CANopen connection.

Object description

Index	1005 _h
Object Name	COB-ID Sync
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000080 _h
Firmware Version	FIR-v1426
Change History	

1007h Synchronous Window Length

Function

This object contains the length of the time window in microseconds for synchronous PDOs.

The value 0 switches of the time window, the PDOs can therefore be sent at any time.

This object is only present in device variants with a CANopen connection.

Object description

Index	1007 _h
Object Name	Synchronous Window Length
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

1008h Manufacturer Device Name

Function

Contains the device name as a string.

Object description

Index	1008 _h
Object Name	Manufacturer Device Name
Object Code	VARIABLE
Data type	VISIBLE_STRING
Persistent	No
Access	Read only
PDO Mapping	No

Admissible Values	
Specified Value	
Firmware Version	FIR-v1426
Change History	

Description

The length of the string appears in subindex 0 of this object. The individual characters are contained as of subindex 1. The character string is not terminated by a zero string.

1009h Manufacturer Hardware Version

Function

This object contains the hardware version as a string.

Object description

Index	1009 _h
Object Name	Manufacturer Hardware Version
Object Code	VARIABLE
Data type	VISIBLE_STRING
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	
Firmware Version	FIR-v1426
Change History	

Description

The length of the string appears in subindex 0 of this object. The individual characters are contained as of subindex 1. The character string is not terminated by a zero string.

100Ah Manufacturer Software Version

Function

This object contains the software version as a string.

Object description

Index	100A _h
Object Name	Manufacturer Software Version
Object Code	VARIABLE
Data type	VISIBLE_STRING
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	FIR-v1436
Firmware Version	FIR-v1426

Change History

Description

The length of the string appears in subindex 0 of this object. The individual characters are contained as of subindex 1. The character string is not terminated by a zero string.

100Ch Guard Time

Function

This object is a time in milliseconds that is multiplied by object **100D_h** to yield the specified value for "node guarding" of the "Network Management" CANopen service.

This object is only present in device variants with a CANopen connection.

Object description

Index	100C _h
Object Name	Guard Time
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

100Dh Live Time Factor

Function

This object is a multiplier that is multiplied by object **100C_h** to yield the time window for the "node guarding" protocol in milliseconds.

This object is only present in device variants with a CANopen connection.

Object description

Index	100D _h
Object Name	Live Time Factor
Object Code	VARIABLE
Data type	UNSIGNED8
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00 _h
Firmware Version	FIR-v1426

Specified Value	00000001 _h
Subindex	02 _h
Name	Save The Comm Parameters To Non-volatile Memory
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000001 _h
Subindex	03
Name	Save The Application Parameters To Non-volatile Memory
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No

Admissible Values
Specified Value 00000001_h

Description

To start the saving procedure the value 65766173_h has to be written to subindex 1 or 2. This accords to the decimal value 1702257011_d respectively the ASCII string " save".

1011h Restore Default Parameters

Function

This object can be used to reset the entire object directory to the default values.

Object description

Index	1011 _h
Object Name	Restore Default Parameters
Object Code	ARRAY
Data type	UNSIGNED32
Persistent	No
Firmware Version	FIR-v1426
Change History	Firmware Version FIR-v1436: Entry "Object Name" modified from "Restore Default Parameter" to "Restore Default Parameters". Firmware Version FIR-v1436: Amount of subentries has changed from 2 to 4.

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	03 _h
Subindex	01 _h
Name	Restore All Default Parameters
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Subindex	02
Name	Restore The Comm Default Parameters
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	

Specified Value	00000000 _h
Subindex	03
Name	Restore The Application Default Parameters
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h

Description

When value 64616F6C_h (or 1684107116_d or "load" in ASCII) is written into this object, the entire object directory is reset to the default values.

Note

For the reset to take effect, the motor controller reboots at the end.

1014h COB-ID EMCY

Function

This object describes CobId of "Emergency Service" under CANopen.

Object description

Index	1014 _h
Object Name	COB-ID EMCY
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: communication
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

1017h Producer Heartbeat Time

Function

This object specifies the heartbeat time of the CANopen services network management in milliseconds. No heartbeat message is sent when the object is set to the value 0.

This object is only present in device variants with a CANopen connection.

Object description

Index	1017 _h
Object Name	Producer Heartbeat Time
Object Code	VARIABLE
Data type	UNSIGNED16

Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	Version FIR-v1422-B36464: Name entry changed from "Producer heartbeat time" to "Producer Heartbeat Time"

1018h Identity Object

Function

The object contains information on the manufacturer, the product code and the revision and serial numbers.

Object description

Index	1018 _h
Object Name	Identity Object

Description

Each subindex (1-8) describes a mapped object.

A mapping entry consists of four bytes made up according to the following graphic.

Index [16]

Contains the index of the object to be mapped

Subindex [8]

Contains the subindex of the object to be mapped

Length [8]

Contains the length of the object to be mapped in the bit unit.

1A01h Transmit PDO 2 Mapping Parameter

Function

This object specifies an output PDO mapping of the active field bus (EtherCAT or CANopen).

Object description

Index	1A01h
Object Name	Transmit PDO 2 Mapping Parameter
Object Code	RECORD
Data type	PDO_MAPPING
Persistent	yes, category: communication
Firmware Version	FIR-v1426
Change History	Firmware Version FIR-v1426: Entry "caption" modified from "1A01h Positioning Status" to "1A01h Transmit PDO 2 Mapping Parameter". Firmware Version FIR-v1426: Entry "Object Name" modified from "Positioning Status" to "Transmit PDO 2 Mapping Parameter".

Description

Each subindex (1-8) describes a mapped object.

A mapping entry consists of four bytes made up according to the following graphic.

Index [16]

Contains the index of the object to be mapped

Subindex [8]

Contains the subindex of the object to be mapped

Length [8]

Contains the length of the object to be mapped in the bit unit.

1A02h Transmit PDO 3 Mapping Parameter

Function

This object specifies an output PDO mapping of the active field bus (EtherCAT or CANopen).

Object description

Index	1A02h

Description

Each subindex (1-8) describes a mapped object.

A mapping entry consists of four bytes made up according to the following graphic.

Index [16]

Contains the index of the object to be mapped

Subindex [8]

Contains the subindex of the object to be mapped

Length [8]

Contains the length of the object to be mapped in the bit unit.

2005h CANopen Baudrate

Function

This object contains the baud rate of the CANopen bus if a value greater than or equal to "80"_h was set at the rotary switches.

Object description

Index	2005 _h
Object Name	CANopen Baudrate
Object Code	VARIABLE
Data type	UNSIGNED8
Persistent	yes, category: communication
Access	Read/write

PDO Mapping	No
Admissible Values	
Specified Value	88 _h
Firmware Version	FIR-v1426
Change History	

Description

The baud rates are to be set according to the following table. Every value outside of this table is interpreted as 1000 kBd.

Value		Baud rate
dec	hex	in kBd
129	81	10
130	82	20
131	83	50
132	84	125
133	85	250
134	86	500
135	87	1000
136	88	1000

2009h CANopen NodeID

Function

This object contains the NodeID of the device that is used if the rotary switches were used to set the number 00_h or 80_h.

Object description

Index	2009 _h
Object Name	CANopen NodeID
Object Code	VARIABLE
Data type	UNSIGNED8
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	7F _h
Firmware Version	FIR-v1426
Change History	

2010h IP-Configuration

Function

This object is used to set the network configuration.

Object description

Index	2010 _h
-------	-------------------

Object Name	IP-Configuration
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

IP

Value = "1": A static IP address is used from object **2011_h** and the network mask from object **2012_h** is used.

UPnP

Value = "1": UPnP (Universal Plug and Play) notifications will be activated

DHCP

Value = "1": IP address allocation by a DHCP server will be activated

AUTO

Value = "1": IP address allocation by the AUTO-IP protocol will be activated

OFF

Value = "1": Network interface will be deactivated

2011h Static-IP-Address

Function

Contains the static IPv4 address in the form of a 32-bit word.

Object description

Index	2011 _h
Object Name	Static-IP-Address
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426

Change History

Description

IP Address Part 1 [8]

Specifies the first part of the IP address

IP Address Part 2 [8]

Specifies the second part of the IP address

IP Address Part 3 [8]

Specifies the third part of the IP address

IP Address Part 4 [8]

Specifies the fourth part of the IP address

Example

The address 192.168.2.0 is first converted to the hexadecimal notation and then yields the following configuration value:

192 => C0_h

168 => A8_h

2 => 02_h

0 => 0

The associated setting value is then C0A80200_h.

2012h Static-IP-Subnet-Mask

Function

Contains the subnet mask of the static IP address in the form of a 32-bit word.

Object description

Index	2012 _h
Object Name	Static-IP-Subnet-Mask
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: communication
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Subnet Mask Part 1 [8]								Subnet Mask Part 2 [8]

Subnet Mask Part 3 [8]								Subnet Mask Part 4 [8]							

Subnet Mask Part 1 [8]

Specifies the first part of the subnet mask

Subnet Mask Part 2 [8]

Specifies the second part of the subnet mask

Subnet Mask Part 3 [8]

Specifies the third part of the subnet mask

Subnet Mask Part 4 [8]

Specifies the fourth part of the subnet mask

Example

The class C network mask 255.255.255.0 is first converted to the hexadecimal system and then yields the following configuration value:

255 => FF_h

0 => 0

The associated setting value is then FFFFFFFF00_h.

2018h Current-IP-Address

Function

Contains the currently active IP address in the form of a 32-bit word.

Object description

Index	2018 _h
Object Name	Current-IP-Address
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

IP Address Part 1 [8]

Specifies the first part of the IP address

IP Address Part 2 [8]

Specifies the second part of the IP address

IP Address Part 3 [8]

Specifies the third part of the IP address

IP Address Part 4 [8]

Specifies the fourth part of the IP address

Example

The address 192.168.2.0 is first converted to the hexadecimal notation and then yields the following configuration value:

192 => C0_h

168 => A8_h

2 => 02_h

0 => 0

The associated setting value is then C0A80200_h.

2019h Current-IP-Subnet-Mask

Function

Contains the currently active subnet mask of the static IP address in the form of a 32-bit word.

Object description

Index	2019 _h

Example

The class C network mask 255.255.255.0 is first converted to the hexadecimal system and then yields the following configuration value:

255 => FF_h

0 => 0

The associated setting value is then FFFFFFFF00_h.

2022h Drive Serial Number

Function

This object contains the serial number of the motor controller.

Object description

Index	2022 _h
Object Name	Drive Serial Number
Object Code	VARIABLE
Data type	VISIBLE_STRING
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	
Firmware Version	FIR-v1426
Change History	Version FIR-v1422-B36464: Name entry changed from "Drive serial number" to "Drive Serial Number"

2030h Pole Pair Count

Function

Contains the pole pair count of the connected motor.

Object description

Index	2030 _h
Object Name	Pole Pair Count
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000032 _h
Firmware Version	FIR-v1426
Change History	Version FIR-v1422-B36464: Name entry changed from "Pole pair count" to "Pole Pair Count"

2031h Peak Current

Function

Specifies the maximum current in mA.

Object description

Index	2031 _h
Object Name	Peak Current
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000708 _h
Firmware Version	FIR-v1426
Change History	

2032h Maximum Speed

Function

Specifies the maximum admissible speed of the v-control in revolutions/s or rpm.

Object description

Index	2032 _h
Object Name	Maximum Speed

Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00030D40 _h
Firmware Version	FIR-v1426
Change History	

Description

The conversion is based on the numerator and denominator specified in object **604C_h**.

2033h Plunger Block

Function

Specifies the maximum positional change in user units (corresponding to Target Position **607A_h**) that is permitted in the corresponding direction.

Object description

Index	2033 _h
Object Name	Plunger Block
Object Code	VARIABLE
Data type	INTEGER32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

This is used to implement an electronic lock.

The value 0 switches the monitoring of.

For example, the value 100 means that the drive may move in the negative direction by any distance, but as soon as it moves in the positive direction by more than 100 steps the motor is stopped immediately and an error is output.

For example, when winding up threads, this can be used to prevent an accidental unwinding of threads.

2034h Upper Voltage Warning Level

Function

This object holds the threshold level for the "Overvoltage" error in millivolts.

Object description

Index	2034 _h
Object Name	Upper Voltage Warning Level
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	000128E0 _h
Firmware Version	FIR-v1426
Change History	

Description

If the input voltage of the motor controller rises above this threshold value, the motor is switched off and an error is output. This error is automatically reset when the input voltage is less than (voltage of the object 2036_h minus 2 volts).

2035h Lower Voltage Warning Level

Function

This object holds the threshold level for the "Undervoltage" error in millivolts.

Object description

Index	2035 _h
Object Name	Lower Voltage Warning Level
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00004650 _h
Firmware Version	FIR-v1426
Change History	

Description

If the input voltage of the motor controller drops below this threshold value, the motor is switched off and an error is output. This error is automatically reset when the input voltage is greater than (voltage of the object 2035_h plus 2 volts).

2036h Open Loop Current Reduction Idle Time

Function

This object specifies the time in milliseconds for which the motor must be idling before the current reduction is activated.

Object description

Index	2036 _h
Object Name	Open Loop Current Reduction Idle Time
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	000003E8 _h
Firmware Version	FIR-v1426
Change History	

2037h Open Loop Current Reduction Value/factor

Function

This object specifies the value to which the current must be reduced when current reduction is activated in open loop.

Object description

Index	2037 _h
Object Name	Open Loop Current Reduction Value/factor
Object Code	VARIABLE
Data type	INTEGER32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	FFFFFFCE _h
Firmware Version	FIR-v1426
Change History	

Description

If the value is negative between "-100" and "-1", this is interpreted as the percentage reduction factor relative to the maximum current (**2031_h**). The value "-100" corresponds to 100% of the value in object **2031_h**, and the value "-50" is interpreted as 50% of the value in object **2031_h**, etc.

If the value is positive, the current is reduced to the value in mA entered in object **2037_h**.

2038h Brake Controller Timing

Function

This object contains the times for the brake controller in milliseconds as well as the PWM frequency and duty cycle.

Object description

Index	2038 _h
Object Name	Brake Controller Timing

Object Code	ARRAY
Data type	UNSIGNED32
Persistent	yes, category: user
Firmware Version	FIR-v1426
Change History

Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	between 2 and 100
Specified Value	00000000 _h

Description

The subindices have the following functions:

- 01_h: Time between when the motor begins idle and the brake closes.
- 02_h: Time between when the brake closes and the current is lowered.
- 03_h: Time between when a new move command is set and the brake is opened.
- 04_h: Time between when the brake is opened and the motor starts.
- 05_h: Frequency of the brake PWM in hertz.
- 06_h: Duty cycle of the brake PWM in percent.

2039h Motor Currents

Function

This object contains the measured motor currents in mA.

Admissible Values	
Specified Value	
Firmware Version	FIR-v1426

Change History Amount of subentries has changed from 3 to 4

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	03 _h
Subindex	01 _h
Name	Minimum Current For Block Detection
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Subindex	02 _h
Name	Period Of Blocking
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Subindex	03
Name	Block Detection Time
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h

Description

The subentries have the following function:

- 01_h: Specifies the current limit value from which blocking is to be detected.
- 02_h: Specifies the time in ms that the motor is nevertheless still to travel against the block after block detection.
- 03_h: Specifies the time in ms that the current has to be at least above the minimum current threshold in order to detect a block.

203Bh I2t Parameters

Function

This object contains the parameters for the I²t monitoring.

The I^2t monitoring is activated when a value greater than 0 is entered in 203B_h:02_h (see " **I2t motor overload protection** ").

I^2t can only be use for closed loop mode with a single exception: If I^2t is activated in open loop mode, the current is limited to the set nominal current even when the set maximum current is greater. This feature was implemented for safety reasons, so that it is also possible to switch out of closed loop mode and into open loop mode with a very high short-time maximum current without damaging the motor.

Object description

Index	203B _h
Object Name	I2t Parameters
Object Code	ARRAY
Data type	UNSIGNED32
Persistent	No
Firmware Version	FIR-v1426
Change History	Amount of subentries has changed from 3 to 7

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	06 _h
Subindex	01 _h
Name	Nominal Current
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values

Specified Value	00000000 _h
Subindex	04
Name	CalcValue
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Subindex	05
Name	LimitedCurrent
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Subindex	06
Name	Status
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h

Description

The subentries have the following function:

- 01_h: Specifies the nominal current in mA, must be smaller than the maximum current **2031_h**, otherwise monitoring will not be activated.
- 02_h: Specifies the maximum time period of the peak current in ms.
- 03_h: Threshold, specifies the limit in mA, from which is determined whether switching is to the maximum current or nominal current.
- 04_h: CalcValue, specifies the calculated value that is compared to the threshold in order to set the current.
- 05_h: LimitedCurrent, shows the actual current value that was set by I²t.
- 06_h: Actual status. If the subentry value is "0", I²t is deactivated; if the value is "1", I²t is activated

2050h Encoder Alignment

Function

This value specifies the angle offset between the rotor and the electrical field.

Object description

Index	2050 _h
Object Name	Encoder Alignment
Object Code	VARIABLE
Data type	INTEGER32
Persistent	No

Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

The exact determination is only possible via the auto setup. The presence of this value is required for closed loop mode.

2051h Encoder Optimization

Function

Contains compensation values to attain better concentricity in closed loop mode.

Object description

Index	2051 _h
Object Name	Encoder Optimization
Object Code	ARRAY
Data type	INTEGER32
Persistent	No
Firmware Version	FIR-v1426
Change History	

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	03 _h

Subindex	01 _h
Name	Parameter 1
Data type	INTEGER32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h

Subindex	02 _h
Name	Parameter 2
Data type	INTEGER32
Access	Read/write

Specified Value	00000000 _h
Subindex	03 _h
Name	Parameter 3
Data type	INTEGER32
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h

Description

The exact determination is only possible via the auto setup.

2052h Encoder Resolution

Function

Contains the resolution of the encoder that is used for electrical commutation.

Object description

Index	2052 _h
Object Name	Encoder Resolution
Object Code	VARIABLE
Data type	INTEGER32
Persistent	No
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

A negative value means that the encoder is operated in the opposite direction to the motor. This can be corrected by changing the poles of the motor winding.

2053h Index Polarity

Function

Specifies the index polarity.

Object description

Index	2053 _h
Object Name	Index Polarity
Object Code	VARIABLE
Data type	UNSIGNED8
Persistent	No
Access	Read/write

PDO Mapping	No
Admissible Values	
Specified Value	00 _h
Firmware Version	FIR-v1426
Change History	

Description

The value 0 means that the index is not inverted.

The value 1 means that the index is connected inverted and is inverted in the firmware.

2054h Index Width

Function

Specifies the index width in an internal operand.

Object description

Index	2054 _h
Object Name	Index Width
Object Code	VARIABLE
Data type	INTEGER32
Persistent	No
Access	Read/write
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	FFFFFFFF _h
Firmware Version	FIR-v1426
Change History	

Description

If this value is not equal to 0, the encoder is monitored for errors.

The value -1 (FFFFFFFF_h) deactivates encoder monitoring.

2056h Limit Switch Tolerance Band

Function

Specifies how far positive or negative limit switches may be overrun before the motor controller issues an error.

This tolerance range is required, for example, to be able to complete reference runs - in which limit switches can be activated - error-free.

Object description

Index	2056 _h
Object Name	Limit Switch Tolerance Band
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write

PDO Mapping	TX - PDO
Admissible Values	
Specified Value	000001F4 _h
Firmware Version	FIR-v1426
Change History	

2057h Clock Direction Multiplier

Function

The clock counting value in the clock/direction mode is multiplied by this value before it is processed further.

Object description

Index	2057 _h
Object Name	Clock Direction Multiplier
Object Code	VARIABLE
Data type	INTEGER32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000080 _h
Firmware Version	FIR-v1426
Change History	

2058h Clock Direction Divider

Function

The clock counting value in the clock/direction mode is divided by this value before it is processed further.

Object description

Index	2058 _h
Object Name	Clock Direction Divider
Object Code	VARIABLE
Data type	INTEGER32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000001 _h
Firmware Version	FIR-v1426
Change History	

2059h Encoder Configuration

Function

This object specifies the supply voltage of the encoder.

Object description

Index	2059 _h
Object Name	Encoder Configuration
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
														TYPE	VOLT

VOLT

Setting this bit to the value "0" the supply voltage of the encoder is set to 5V. Setting this bit to the value "1" the supply voltage of the encoder is set to 24V.

TYPE

Defines the type of the encoder. This bit has to be set to the value "0" if a differential encoder is used. For a single ended encoder, the bit has to be set to the value "1".

2060h Compensate Polepair Count

Function

Makes it possible to order motor-independent motion blocks.

Object description

Index	2060 _h
Object Name	Compensate Polepair Count
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000001 _h

Firmware Version FIR-v1426
Change History

Description

If this entry is set to 1, the pole pair count is automatically set for all position, speed, acceleration, and jerk parameters.

If the value is 0, the pole pair count enters into the set values and must be taken into account when the motor is changed, as is the case with conventional stepper motor controllers.

2061h Velocity Numerator

Function

Contains the numerator that is used to convert the speed specifications in profile position mode.

Object description

Index	2061 _h
Object Name	Velocity Numerator
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000001 _h
Firmware Version	FIR-v1426
Change History	

Description

The internal operand pertains to full mechanical (**2060_h=1**) or electrical (**2060_h=0**) revolutions per second.

Thus, by setting object **2061_h=1** and object **2062_h=60**, for example, the speed can be specified in rpm in profile position mode.

2062h Velocity Denominator

Function

Contains the denominator that is used to convert the speed specifications in profile position mode.

Object description

Index	2062 _h
Object Name	Velocity Denominator
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	

Specified Value	0000003C _h
Firmware Version	FIR-v1426
Change History	

Description

The internal operand pertains to full mechanical (**2060_h**=1) or electrical (**2060_h**=0) revolutions per second.

Thus, by setting object **2061_h**=1 and object **2062_h**=60, for example, the speed can be specified in rpm in profile position mode.

2063h Acceleration Numerator

Function

Contains the numerator that is used to convert the acceleration specifications in profile position mode.

Object description

Index	2063 _h
Object Name	Acceleration Numerator
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000001 _h
Firmware Version	FIR-v1426
Change History	

Description

The internal operand pertains to full mechanical (**2060_h**=1) or electrical (**2060_h**=0) revolutions per second.

Thus, by setting object **2063_h**=1 and object **2064_h**=60, for example, the acceleration can be specified in (revolutions/min)/s² in profile position mode.

2064h Acceleration Denominator

Function

Contains the denominator that is used to convert the acceleration specifications in profile position mode.

Object description

Index	2064 _h
Object Name	Acceleration Denominator
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write

PDO Mapping	No
Admissible Values	
Specified Value	0000003C _h
Firmware Version	FIR-v1426
Change History	

Description

The internal operand pertains to full mechanical (**2060**_h=1) or electrical (**2060**_h=0) revolutions per second.

Thus, by setting object **2063**_h=1 and object **2064**_h=60, for example, the acceleration can be specified in (revolutions/min)/s² in profile position mode.

2065h Jerk Numerator

Function

Contains the numerator that is used to convert the jerk specifications in profile position mode.

Object description

Index	2065 _h
Object Name	Jerk Numerator
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000001 _h
Firmware Version	FIR-v1426
Change History	

Description

The internal operand pertains to full mechanical (**2060**_h=1) or electrical (**2060**_h=0) revolutions per second to the power of 3.

Thus, by setting object **2065**_h=1 and object **2066**_h=60, for example, the jerk can be specified in (revolutions/min)/s² in profile position mode.

2066h Jerk Denominator

Function

Contains the denominator that is used to convert the jerk specifications in profile position mode.

Object description

Index	2066 _h
Object Name	Jerk Denominator
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user

Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	0000003C _h
Firmware Version	FIR-v1426
Change History	

Description

The internal operand pertains to full mechanical (**2060_h**=1) or electrical (**2060_h**=0) revolutions per second.

Thus, by setting object **2065_h**=1 and object **2066_h**=60, for example, the acceleration can be specified in (revolutions/min)/s² in profile position mode.

2084h Bootup Delay

Function

This object allows specification of the time period between when the supply voltage is applied to the motor controller and the provision of operability of the motor controller in milliseconds.

Object description

Index	2084 _h
Object Name	Bootup Delay
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

2101h Fieldbus Module

Function

Shows the type of mounted field bus module.

Object description

Index	2101 _h
Object Name	Fieldbus Module
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h

Firmware Version	FIR-v1426
Change History	Firmware Version FIR-v1426: Entry "Data Type" modified from "INTEGER32" to "UNSIGNED32"

Description

The bits 0 to 15 are representing the physical interface, the bits 16 to 31 the used protocol (if necessary).

USB

Value = "1": An USB interface is available.

RS-485

Value = "1": A RS-485 interface is available.

RS-232

Value = "1": A RS-232 interface is available.

CAN

Value = "1": A CANopen interface is available.

E-NET

Value = "1": An EtherNET interface is available.

E-CAT

Value = "1": An EtherCAT interface is available.

SPI

Value = "1": A SPI interface is available.

MRTU

Value = "1": The protocol used is Modbus RTU.

TCP

Value = "1": The protocol used is TCP/IP

2200h Sampler Control

Function

Controls the installed sampler used to cyclically record any values from the "Dictionary" object.

Object description

Index	2200 _h
Object Name	Sampler Control
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read/write

Admissible Values	
Specified Value	00000000 _h

Description

Each subindex (1-8) describes a mapped object.

A mapping entry consists of four bytes made up according to the following graphic.

Index [16]

Contains the index of the object to be mapped

Subindex [8]

Contains the subindex of the object to be mapped

Length [8]

Contains the length of the object to be mapped in the bit unit.

2203h Sampler Buffer Information

Function

This object makes additional information available to the sampler.

Object description

Index	2203 _h
Object Name	Sampler Buffer Information
Object Code	ARRAY
Data type	UNSIGNED32
Persistent	No
Firmware Version	FIR-v1426

Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	Firmware Version FIR-v1436: Entry "Object Name" modified from "VMM Error Code" to "NanoJ Error Code".

Description

Error codes during program execution:

Number	Description
0x0000	No error
0x0001	Invalid service call (Cortex Svc)
0x0002	Memory protection violation (Cortex MPU Fault)
0x0003	Invalid Usage (Cortex error, for example due to an assembler command that is not admissible in the user mode)
0x0004	Hard fault (Cortex error)
0x0005	Timeout of 1-ms cycle
0x0006	Bus fault (Cortex error)
0x0007	Invalid stackpointer
0x0100	Bad program file

File system error codes when loading the user program:

Number	Description
0x10000	Access to an object that doesn't exist in object dictionary
0x10001	Write access to a read only (write protected) object
0x10002	Internal file system fault
0x10003	Storage medium not ready
0x10004	File not found
0x10005	Directory not found
0x10006	Invalid file name/directory name

Number	Description
0x10008	Access to file not possible
0x10009	Invalid file/directory object
0x1000A	Storage medium is write protected
0x1000B	Invalid drive number
0x1000C	Working range of drive is invalid
0x1000D	No valid file system on drive
0x1000E	Creation of the file system has failed
0x1000F	Access not possible within required time
0x10010	Access was rejected

2303h Number Of Active User Program

Function

Selects one of four possible user programs whose file names were stored earlier in object **2304_h**.

Object description

Index	2303 _h
Object Name	Number Of Active User Program
Object Code	VARIABLE
Data type	UNSIGNED8
Persistent	yes, category: user
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00 _h
Firmware Version	FIR-v1426
Change History	

Description

A change to the entry while a user program is being executed leads to the following procedure:

- The current program is stopped.
- The newly selected program is loaded.
- The newly loaded program is started.

2304h Table Of Available User Programs

Function

The file names of the available user programs are stored here.

Object description

Description

For each user program, the name of the user program is contained in two consecutive subindices in ASCII code.

Program 1: subindices 1 and 2

Program 2: subindices 3 and 4

Program 3: subindices 5 and 6

Program 4: subindices 7 and 8

Example: Program 1 with the name `test.usr` is coded as follows:

t = 74_h

e = 65_h

s = 73_h

Thus the two entries in subindices 1 and 2 are:

74657374_h, 00000000_h

For each user program, the name of the user program is contained in two consecutive subindices in ASCII code. The subindex with the designation UB (Upper Byte) contains the first four letters of the name, the subindex with LB (Lower Byte) the last four letters. Should the name have less than eight letters, the missing letters must be filled with zeros.

230Fh Uptime Seconds

Function

This object contains the power-on hours since the last power-on in seconds.

Hinweis

This object won't get saved, the counting will start with "0" after power-on.

Object description

Description

Each subindex (1-16) describes a mapped object.

A mapping entry consists of four bytes made up according to the following graphic.

Index [16]

Contains the index of the object to be mapped

Subindex [8]

Contains the subindex of the object to be mapped

Length [8]

Contains the length of the object to be mapped in the bit unit.

2320h NanoJ Output Data Selection

Function

Specifies the object dictionary entries that are copied into the output PDO mapping of the VMM program after it has been executed.

Description

This is where the specified values, for example, can be transferred to the VMM program.

2500h NanoJ Outputs

Function

Contains an array with 32 32-bit integer values that is not used within the firmware and is only used for communication with the user program via the field bus.

Description

The VMM program can store results here that can then be read out via the field bus.

2600h NanoJ Debug Output

Function

This object contains debug outputs for a user program.

Object description

Index	2600 _h
Object Name	NanoJ Debug Output
Object Code	ARRAY
Data type	UNSIGNED8
Persistent	No
Firmware Version	FIR-v1426
Change History	Amount of subentries has changed from 2 to 65 Firmware Version FIR-v1436: Entry "Object Name" modified from "VMM Debug Output" to "NanoJ Debug Output".

Description

The VMM program stores the debug outputs here that have been called up with the function `VmmDebugOutputString()`, `VmmDebugOutputInt()`, and suchlike. A detailed description of the debug output can be found in the "Debug output" sub-section of the "Programming with NanoJ" section.

3202h Motor Drive Submode Select

Function

Controls the control mode such as the closed loop /open loop changeover and whether velocity mode is simulated via the S control, or whether it operates with a true v control in the closed loop.

Object description

Index	3202 _h
Object Name	Motor Drive Submode Select
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

CL/OL

Switchover between open loop and closed loop

- Value = "0": Open loop
- Value = "1": Closed loop

VoS

Value = "1": Simulate v-control via an S ramp

Brake

Value = "1": Switch on the brake controller

CurRed (Current Reduction)

Value = "1": Current reduction activated in open loop

Torque

Only active in **Profile torque** Mode

Value = "1": M-control is active, otherwise a V-control is superimposed

BLDC

Value = "1": Motor type "BLDC" (brushless DC motor)

Ferr (Following Error)

Value = "1": A "following error" triggers a fault with an associated response (see object **605E_h**)

320Ah Motor Drive Sensor Display Open Loop

Function

It can be used to change the source for objects **6044_h** and **6064_h** in open loop mode.

Object description

Index	320A _h

Description

- Subindex 00_h: Number of entries
- Subindex 01_h: Proportional value of the S control
- Subindex 02_h: Integral value of the S control
- Subindex 03_h: Proportional value of the V control
- Subindex 04_h: Integral value of the V control
- Subindex 05_h: (Closed Loop) Proportional value of the current controller for the field-forming component
- Subindex 06_h: (Closed Loop) Integral value of the current controller for the field-forming component
- Subindex 07_h: (Closed Loop) Proportional value of the current controller for the torque-forming component
- Subindex 08_h: (Closed Loop) Integral value of the current controller for the torque-forming component
- Subindex 09_h: (Open Loop) Proportional value of the current controller for the torque-forming component
- Subindex 0A_h: (Open Loop) Integral value of the current controller for the torque-forming component

3220h Analog Inputs

Function

Shows the present values of the analog inputs in [digits].

Object **3221_h** allows the respective analog input to be configured as a current or voltage input.

Object description

Index	3220 _h
Object Name	Analog Inputs
Object Code	ARRAY
Data type	INTEGER16
Persistent	No
Firmware Version	FIR-v1426
Change History	

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	02 _h
Subindex	01 _h
Name	Analogue Input 1
Data type	INTEGER16
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	0000 _h
Subindex	02 _h
Name	Analogue Input 2
Data type	INTEGER16
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	0000 _h

Description

Formulas for conversion of [digits] into the respective unit:

- Voltage input: $(x \text{ digits} - 512 \text{ digits}) * 20 \text{ V}/1024 \text{ digits}$
- Current input: $x \text{ digits} * 20 \text{ mA}/1024 \text{ digits}$

3221h Analogue Inputs Control

Function

This object can be used to change an analog input from voltage to current measurement.

Object description

Index	3221 _h
-------	-------------------

Object Name	Analogue Inputs Control
Object Code	VARIABLE
Data type	INTEGER32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
														AC2	AC1

In general: If a bit is set to 0, the analog input measures the voltage; if the bit is set to 1, the current is measured.

AC1

Setting for analog input 1

AC2

Setting for analog input 2

3225h Analogue Inputs Switches

Function

This object contains either the adjusted CANopen nodeID of the rotary switch or the positions of the DIP switches

Object description

Index	3225 _h
Object Name	Analogue Inputs Switches
Object Code	ARRAY
Data type	UNSIGNED16
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	
Firmware Version	FIR-v1436
Change History	Firmware Version FIR-v1436: Entry "Data type" modified from "UNSIGNED16" to "UNSIGNED8".

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values

Subindex	01 _h
Name	Analogue Input Switch1
Data type	UNSIGNED16
Access	Read only
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000 _h

Description

In subindex 1 the nodeld of the rotary switch(es) is registered if a CANopen interface is available to the controller.

When a DIP-Switch is fitted to the controller, the positions of the DIP switches are stored in subindex 1. Bit 0 accords the switch 1, the value of the bit is "1" if the switch is set to "on".

3240h Digital Inputs Control

Function

This object can be used to manipulate the digital inputs as described in the "**Digital inputs and outputs**" section. For all the following subindices, bit 0 pertains to digital input 1, bit 1 pertains to input 2, etc.

Object description

Index	3240 _h
Object Name	Digital Inputs Control
Object Code	ARRAY
Data type	UNSIGNED32
Persistent	yes, category: user

Subindex	07 _h
Name	Differential Select
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000000 _h

Description

The subentries have the following function:

- 01_h: This subindex switches on the special functions of the respective input if the bit has the value "1".
- 02_h: This subindex inverts the logic of an input if the respective input has the value "1".
- 03_h: This subindex forces an input value if the bit has the value "1". An input with a forced value is always set to the value entered in subentry 4_h regardless of the applied voltage level.
- 04_h: This subindex specifies the input value to be forced.
- 05_h: This subindex always contains the read, unmodified input value.
- 06_h: This subindex switches the switching thresholds between 5 V (value "0") and 24 V (value "1") if the input supports this function.
- 07_h: This subindex switches the inputs from a a single ended (value "0") to differential (value "1") input if the inputs support this function.

3250h Digital Outputs Control

Function

This object can be used to control the digital outputs as described in the "**Digital inputs and outputs**" section. For all the following subindices, bit 0 pertains to digital output 1, bit 1 pertains to output 2, etc.

Object description

Index	3250 _h
Object Name	Digital Outputs Control
Object Code	ARRAY
Data type	UNSIGNED32
Persistent	yes, category: user
Firmware Version	FIR-v1426
Change History	Firmware Version FIR-v1426: Subindex 01 _h : Entry "Name" changed from "Special Function Disable" auf "Special Function Enable"

Subindex	05 _h
Name	Raw Value
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000000 _h

Description

The subentries have the following function:

- 01_h: No function.
- 02_h: This subindex inverts the logic (from opener logic to closer logic)
- 03_h: This subindex forces an output value if the bit has the value "1". The level of the output is defined in subindex 4_h.
- 04_h: This subindex defines the level to be applied to the output. The value "0" delivers a logical low level at the digital output; value "1" delivers a logical high level.
- 05_h: In this subindex, the bit combination applied to the outputs is stored.

3320h Read Analogue Input

Function

DESCRIPTION!

Object description

Index	3320 _h
Object Name	Read Analogue Input
Object Code	ARRAY
Data type	INTEGER32
Persistent	No
Access	Read only
PDO Mapping	No

Description

- Subindex 00_h: Number of dividers
- Subindex 01_h: Divider for analog input 1
- Subindex 02_h: Divider for analog input 2

3700h Following Error Option Code

Function

The object contains the action to be executed if a "following error" is triggered.

Object description

Index	3700 _h
Object Name	Following Error Option Code
Object Code	VARIABLE
Data type	INTEGER16
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	FFFF _h
Firmware Version	FIR-v1426
Change History	

Description

Value	Description
-32768 to -1	Reserved
0	Immediate stop with short-circuit braking
1	Braking with "slow down ramp" (deceleration depending on operating mode)
2	Braking with "quick stop ramp" (deceleration depending on operating mode)
3 to 32767	Reserved

603Fh Error Code

Function

Contains the last error that occurred.

Object description

Index	603F _h
Object Name	Error Code
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

Description

For the meaning of the error, see object **1003_h** (Pre-defined Error Field).

6040h Controlword

Function

The motor is switched on and travel commands can be carried out with this object.

Object description

Index	6040 _h
Object Name	Controlword
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

Description

This object controls the "**DS402 Power State machine**". The function of parts of the object are depending on the currently selected mode.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
						OMS	HALT	FR		OMS [3]		EO	QS	EV	SO

SO (Switched On)

Value = "1": Switches to the "Switched on" state

EV (Enable Voltage)

Value = "1": Switches to the "Enable voltage" state

QS (Quick Stop)

Value = "0": Switches the "Quick stop" state

EO (Enable Operation)

Value = "1": Switches to the "Enable operation" state

OMS [3] (Operation Mode Specific)

Meaning depends on the selected operating mode

FR (Fault Reset)

Resets an error (if possible)

HALT

Value = "1": Triggers a stop

6041h Statusword

Function

This object queries whether the state commanded with object **6040_h** (control word) has been reached.

Object description

Index	6041 _h
Object Name	Statusword
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

Description

This object controls the "**DS402 Power State machine**". The function of parts of the object are depending on the currently selected mode.

15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
CLA		OMS [2]	ILA	TARG	REM	SYNC	WARN	SOD	QS	VE	FAULT	OE	SO	RTSO	

RTSO (Ready To Switch On)

Value = "1": Motor controller is in the "Ready To Switch On" state

SO (Switched On)

Value = "1": Motor controller is in the "Switched On" state

OE (Operational Enabled)

Value = "1": Motor controller is in the state "Operational Enabled" state

FAULT

Error occurred

VE (Voltage Enabled)

Voltage created

QS (Quick Stop)

Value = "0": Motor controller is in the "Quick Stop" state

SOD (Switched On Disabled)

Value = "1": Motor controller is in the "Switched on disabled" state

WARN (Warning)

Value = "1": Warning

REM (Remote)

Remote (value of bit always "1")

TARG (Target Reached)

Target specification reached

ILA (Internal Limit Reached)

Limit exceeded

OMS (Operation Mode Specific)

Meaning depends on the selected operating mode

CLA (Closed Loop Available)

Value = "1": AutoSetup successful and closed loop possible

6042h VI Target Velocity

Function

Specifies the target speed in user units.

Object description

Index	6042 _h
Object Name	VI Target Velocity
Object Code	VARIABLE
Data type	INTEGER16
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00C8 _h
Firmware Version	FIR-v1426
Change History	

6043h VI Velocity Demand

Function

Specifies the actual target speed in user units.

Object description

Index	6043 _h
Object Name	VI Velocity Demand
Object Code	VARIABLE
Data type	INTEGER16
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

6044h VI Velocity Actual Value

Function

Specifies the current actual speed in user units.

In open loop mode, the source of this object can be set either to the internal, calculated value or to the encoder with object **320A_h:03_h**.

In closed loop mode, the source of this object can be set either to the internal, calculated value or to the encoder with object **320B_h:03_h**.

Object description

Index	6044 _h
Object Name	VI Velocity Actual Value
Object Code	VARIABLE
Data type	INTEGER16
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

6046h VI Velocity Min Max Amount

Function

The minimum speed and maximum speed in user units can be set with this object.

Object description

Index	6046 _h
Object Name	VI Velocity Min Max Amount
Object Code	ARRAY
Data type	UNSIGNED32
Persistent	yes, category: user
Firmware Version	FIR-v1426
Change History	

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	02 _h
Subindex	01 _h
Name	MinAmount

Data type	UNSIGNED32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000000 _h
Subindex	02 _h
Name	MaxAmount
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00004E20 _h

Description

Subindex 1 contains the minimum speed.

Subindex 2 contains the maximum speed.

Note

If the magnitude of the specified target speed (object **6042_h**) is less than the minimum speed, the minimum speed applies. If the target speed is 0, the motor stops.

A target speed greater than the maximum speed sets the speed to the maximum speed and sets bit 11 "Limit exceeded" in object **6041_h** (status word).

6048h VI Velocity Acceleration

Function

Sets the acceleration ramp in velocity mode (see " **Velocity**").

Object description

Index	6048 _h
Object Name	VI Velocity Acceleration
Object Code	RECORD
Data type	VELOCITY_ACCELERATION_DECELERATION
Persistent	yes, category: user
Firmware Version	FIR-v1426
Change History	

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values

Subindex	02 _h
Name	DeltaTime
Data type	UNSIGNED16
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0001 _h

Description

The acceleration is specified as a fraction:

Speed change per time change.

Subindex 01_h: Contains the speed change in steps per second (U32).

Subindex 02_h: Contains the time change in seconds (U16).

6049h VI Velocity Deceleration

Function

Sets the brake ramp in velocity mode (siehe chapter " **Velocity** ").

Object description

Index	6049 _h
Object Name	VI Velocity Deceleration
Object Code	RECORD
Data type	VELOCITY_ACCELERATION_DECELERATION
Persistent	yes, category: user

Subindex	02 _h

Name	DeltaTime
Data type	UNSIGNED16
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0001 _h

Description

Subindex 1 contains the speed change, and subindex 2 the associated time in seconds.

Both together are computed as the acceleration:

Velocity Quick Stop = DeltaSpeed (**604A_h:01_h**)/DeltaTime (**604A_h:02_h**)

604Ch VI Dimension Factor

Function

The unit for the speed specifications for the objects that pertain to the Velocity Mode are defined here.

Object description

Index	604C _h
Object Name	VI Dimension Factor
Object Code	ARRAY
Data type	INTEGER32
Persistent	yes, category: user

Subindex	02 _h
Name	VI Dimension Factor Denominator
Data type	INTEGER32
Access	Read/write

PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000003C _h

Description

If subindices 1 and 2 are set to the value "1", the speed is indicated in revolutions per minute.

Otherwise, subindex 1 contains the denominator (multiplier) and subindex 2 the numerator (divisor) with which the speed specifications are computed.

The result is interpreted as revolutions per second; at object **2060_h**, the selection is made of whether these are electrical (**2060_h** = 0) or mechanical (**2060_h** = 1) revolutions per second.

605Ah Quick Stop Option Code

Function

The object contains the action to be executed when the "**DS402 Power State machine**" transitions to the Quick Stop state.

Object description

Index	605A _h
Object Name	Quick Stop Option Code
Object Code	VARIABLE
Data type	INTEGER16
Persistent	yes, category: user

6065h Following Error Window

Function

Specifies the maximum following error symmetrically to the demanded position.

Object description

Index	6065 _h
Object Name	Following Error Window
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000100 _h
Firmware Version	FIR-v1426

Change History

Description

If the difference between the actual position and the set position is so large that value of this object is exceeded, bit 11 is set for "Limit exceeded" in object **6041_h** (status word). The deviation must be longer than the time in object **6066_h**.

To obtain an automatic response to the error, bit 7 must be activated in object **3202_h**. A fault is generated if the "following error" is created – and reacts correspondingly to it (**6041_h** bit 3 "Error occurred").

6066h Following Error Time Out

Function

Time in milliseconds until too large a following error leads to an error message.

Object description

Index	6066 _h
Object Name	Following Error Time Out
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0064 _h
Firmware Version	FIR-v1426
Change History	

Description

If the difference between the actual position and the set position is so large that the value of object **6065_h** is exceeded, bit 11 for "Limit exceeded" is set in **6041_h** (status word). The deviation must be longer than the time in this object.

To obtain an automatic response to the error, bit 7 must be activated in object **3202_h**. A fault is generated if the "following error" is created – and reacts correspondingly to it (**6041_h** bit 3 "Error occurred").

6067h Position Window

Function

Specifies a symmetrical range relative to the target position within which the target is considered to be reached.

Object description

Index	6067 _h
Object Name	Position Window
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No

Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000000A _h
Firmware Version	FIR-v1426
Change History	

6068h Position Window Time

Function

For this time period in milliseconds, the actual position must be within the "Position Window" (**6067**) for the target position to be considered to have been reached.

Object description

Index	6068 _h
Object Name	Position Window Time
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values

Firmware Version	FIR-v1426
Change History	

606Bh Velocity Demand Value

Function

Speed specification for the control in the Profile Velocity Mode.

This object is computed with user-defined units (see also " **User-defined units**"). The motor controller is delivered with the units set to rpm.

Object description

Index	606B _h
Object Name	Velocity Demand Value
Object Code	VARIABLE
Data type	INTEGER32
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

This object contains the output of the ramp generator which is the specified value for the speed controller at the same time.

606Ch Velocity Actual Value

Function

The current actual speed in the profile velocity mode.

Object description

Index	606C _h
Object Name	Velocity Actual Value
Object Code	VARIABLE
Data type	INTEGER32
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

606Dh Velocity Window

Function

Speed window for the Profile Velocity Mode.

Object description

Index	606D _h
Object Name	Velocity Window
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

Description

This value specifies by how much the actual speed may vary from the set speed for bit 10 "Target reached" in status word (**6041_h**) to be set to "1".

606Eh Velocity Window Time

Function

Time window for the Profile Velocity Mode.

Object description

Index	606E _h
Object Name	Velocity Window Time
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

Description

This object specifies how long the actual speed and the set speed must be near each other in magnitude (see 606D_h) for bit 10 "Target reached" in status word (6041_h) to be set to "1".

6071h Target Torque

Function

This object contains the target torque for the Profile Torque Mode.

Object description

Index	6071 _h
Object Name	Target Torque
Object Code	VARIABLE
Data type	INTEGER16
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000 _h
Firmware Version	FIR-v1426
Change History	

6072h Max Torque

Function

The object describes the maximum torque.

Object description

Index	6072 _h
Object Name	Max Torque
Object Code	VARIABLE
Data type	UNSIGNED16
Persistent	yes, category: user
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	0000 _h

Subindex	02 _h
Name	Max Position Range Limit
Data type	INTEGER32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	7FFFFFFE _h

Description

If this range is exceeded or undercut, an overflow occurs. Limit values for the target position can be set in object **607D_h** ("Software Position Limit") to prevent this overflow.

607Ch Home Offset

Function

Specifies the difference between the zero position of the application and the reference point of the machine. This object is computed in the same unit used for calculation for object **607A_h** (see " **User-defined units**").

Object description

Index	607C _h
Object Name	Home Offset
Object Code	VARIABLE
Data type	INTEGER32

Access	Read/write

PDO Mapping	RX - PDO
Admissible Values	
Specified Value	80000000 _h
<hr/>	
Subindex	02 _h
Name	Max Position Limit
Data type	INTEGER32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	7FFFFFFF _h

Description

The target position must lie within the limits set here. Before the check, the home offset (**607C_h**) is deducted in each case:

Corrected min position limit = min position limit - home offset

Corrected max position limit = max position limit - home offset.

607Eh Polarity

Function

This object can be used to reverse the direction of rotation.

Object description

Index	607E _h
Object Name	Polarity
Object Code	VARIABLE
Data type	UNSIGNED8
Persistent	yes, category: user
Access	Read/write
PDO Mapping	No
Admissible Values	
Specified Value	00 _h
Firmware Version	FIR-v1426
Change History	

Description

The general rule for direction reversal is: Reversal is activated if a bit is set to the value "1". If the value is "0", the direction of rotation is as specified in the respective mode

VEL (Velocity)

Reversal of the direction of rotation in the following modes:

- Profile Velocity Mode
- Cyclic Synchronous Velocity Mode

- Velocity Mode

POS (Position)

Reversal of the direction of rotation in the following modes:

- Profile Position Mode
- Cyclic Synchronous Position Mode

6081h Profile Velocity

Function

Specifies the maximum traveling speed in revolutions per second.

This object is computed with user-defined units (see " **User-defined units**"). The motor controller is delivered with the units set to revolutions per minute.

Object description

Index	6081 _h
Object Name	Profile Velocity

Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	02 _h

Subindex	01 _h
Name	Speed During Search For Switch
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000032 _h

Subindex	02 _h
Name	Speed During Search For Zero
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	

Specified Value	00000001 _h
-----------------	-----------------------

Description

This value is computed with the numerator in object **2061_h** and the denominator in object **2062_h**.

The speed for the search of the switch is specified in subindex 1.

The (lower) speed for the search for the reference position is specified in Subindex 2.

Note

- The speed in Subindex 2 is also the starting speed for starting the acceleration ramp. If this is set too high, the motor loses steps or does not rotate at all. An excessive setting leads to the index marking being overlooked. The speed in subindex 2 should therefore be below 1000 steps per second.
- The speed in subindex 1 must be greater than the speed in subindex 2.

609Ah Homing Acceleration

Function

Specifies the acceleration ramp for homing mode in steps/s².

Object description

Index	609A _h
Object Name	Homing Acceleration
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	yes, category: user
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	000001F4 _h
Firmware Version	FIR-v1426
Change History	

Description

The ramp is only used when starting off. When the switch is reached, the unit is automatically switched to the lower speed and is stopped as soon as it reaches the limit position.

60A4h Profile Jerk

Function

In case of a jerk-limited ramp, the magnitude of the jerk can be entered in this object. An entry with the value "0" means that the jerk is not limited.

Object description

Admissible Values	
Specified Value	00001388 _h
Firmware Version	FIR-v1426
Change History	

60F4h Following Error Actual Value

Function

This object contains the current following error.

Object description

Index	60F4 _h
Object Name	Following Error Actual Value
Object Code	VARIABLE
Data type	INTEGER32
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

This object is computed with user-defined units (see " **User-defined units**").

60FDh Digital Inputs

Function

The digital inputs of the motor can be read with this object.

Object description

Index	60FD _h
Object Name	Digital Inputs
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

Description

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
								IN 8	IN 7	IN 6	IN 5	IN 4	IN 3	IN 2	IN 1
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											Dir	CLK	HS	PLS	NLS

NLS (Negative Limit Switch)

Negative limit switch

PLS (Positive Limit Switch)

Positive limit switch

HS (Home Switch)

Reference switch

CLK (Clock)

Clock input

DIR (Direction)

Directional input

IN n (Input n)

Input n - the number of used bits is depending on the respective motor controller.

60FEh Digital Outputs

Function

The digital outputs of the motor can be written with this object.

Object description

Index	60FE _h
Object Name	Digital Outputs
Object Code	ARRAY
Data type	UNSIGNED32
Persistent	No
Firmware Version	FIR-v1426
Change History	

Value description

Subindex	00 _h
Name	Highest Sub-index Supported
Data type	UNSIGNED8
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	01 _h

Subindex	01 _h
Name	Digital Outputs #1
Data type	UNSIGNED32
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000000 _h

Description

The entries in object **3250_h**, subindex 02_h to 05_h still have to be taken into account for writing the outputs.

BRK (Brake)

Bit brake output if the controller supports this functionality.

OUT n (Output No n)

Bit for the respective digital output, the exact number of digital outputs is dependent on the motor controller.

60FFh Target Velocity

Function

The target speed for the Profile Velocity Mode is entered in this object.

This object is computed with user-defined units (see " **User-defined units**"). The motor controller is delivered with the units set to revolutions per minute.

Object description

Index	60FF _h
Object Name	Target Velocity
Object Code	VARIABLE
Data type	INTEGER32
Persistent	No
Access	Read/write
PDO Mapping	RX - PDO
Admissible Values	
Specified Value	00000000 _h
Firmware Version	FIR-v1426
Change History	

6502h Supported Drive Modes

Function

The object specifies the supported drive modes.

Object description

Index	6502 _h
Object Name	Supported Drive Modes
Object Code	VARIABLE
Data type	UNSIGNED32
Persistent	No
Access	Read only
PDO Mapping	TX - PDO
Admissible Values	
Specified Value	000000AF _h
Firmware Version	FIR-v1426
Change History	

Description

A set bit specifies whether the respective mode is supported. The mode is not supported if the value of the bit is "0".

Change History

6505h Http Drive Catalogue Address

Function

This object contains the web address of the manufacturer as a string.

Object description

Index	6505 _h
Object Name	Http Drive Catalogue Address
Object Code	VARIABLE
Data type	VISIBLE_STRING
Persistent	No
Access	Read only
PDO Mapping	No
Admissible Values	
Specified Value	http://www.nanotec.de
Firmware Version	FIR-v1426
Change History

12.7 CMSIS DSP Software Library

Copyright (C) 2010 ARM Limited. All rights reserved.

12.8 FatFs

FatFs - FAT file system module include file R0.08 (C)ChaN, 2010

FatFs module is a generic FAT file system module for small embedded systems.

This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2010, ChaN, all right reserved.

The FatFs module is a free software and there is NO WARRANTY.

No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial product UNDER YOUR RESPONSIBILITY.

Redistributions of source code must retain the above copyright notice.

12.9 Protothreads

Protothread class and macros for lightweight, stackless threads in C++.

This was "ported" to C++ from Adam Dunkels' protothreads C library at: <http://www.sics.se/~adam/pt/>

Originally ported for use by Hamilton Jet (www.hamiltonjet.co.nz) by Ben Hoyt, but stripped down for public release. See his blog entry about it for more information: <http://blog.micropledge.com/2008/07/protothreads/>

Original BSD-style license
